SELECTED WATER RESOURCES ABSTRACTS

UNIVERSITY OF ILLINOIS
SEP 11 1969
LIBRARY

VOLUME 2, NUMBER 17
SEPTEMBER 1, 1969

W69-06841 -- W69-07263

LIBRARY U. OF I., URBANA-CHAMPAIGN

Selected Water Resources Abstracts is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the Clearinghouse for Federal Scientific and Technical Information (CFSTI) of the Bureau of Standards, U. S. Department of Commerce. It is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U. S. Department of the Interior, Washington, D. C. 20240. Annual subscription is $22.00 (domestic), $27.50 (foreign), single copy price is $3.00. Certain documents abstracted in this journal can be purchased from the Clearinghouse at the prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

LIBRARY U. OF I., URBANA-CHAMPAIGN

VOLUME 2, NUMBER 17
SEPTEMBER 1, 1969

W69-06841 -- W69-07263

Use of funds for printing this publication approved by the Director of the Bureau of the Budget, September 4, 1968.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States--now and in the future.

Doc.
I 1.94/2:
2/9-12

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources. WRSIC is not presently prepared to furnish loan or retention copies of the publications announced.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

LIBRARY U. OF I., URBANA CHAMPAIGN

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas. Centers, and their subject coverage, now in operation are:

- Ground and surface water hydrology at the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources management at the Center for Urban Studies of the University of Chicago.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Research Institute of Rutgers University.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

LIBRARY U. OF I. URBANA-CHAMPAIGN

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

STUDIES OF THE WINTER AND SUMMER MONSOONS IN EAST ASIA BASED ON DYNAMIC CONCEPT,
Japan Meteorological Agency (Tokyo).
Atsushi Kurashima.
The Geophys Mag, Vol 34, No 2, pp 145-235, Dec 1968. 91 p, 69 fig, 23 tab, 96 ref.

Descriptors: *Monsoons, *Dynamics, *Seasonal, *Summer, *Winter, Pressure, Air circulation, Tropical regions, Snowfall, Air masses, Rainfall, Anticyclones, Forecasting, Sea level, Frequency, Cyclones.
Identifiers: *East Asia monsoons, Winter monsoons, Summer monsoons.

The author presents a model indicating the synoptic process of the 'outbreak' of a northwestern monsoon in East Asia and shows that various flow patterns of winter monsoons in the neighborhood of Japan correspond to the respective long-wave patterns in upper westerlies. Characteristic parameters of the monsoons in North America and East Asia are discussed. The study indicates the presence of two stages in development of summer monsoons as a result of geographical and climatic conditions. (Gabriel-USGS)
W69-06977

SEASONAL VARIATIONS OF RAINFALL INTENSITIES IN VICTORIA,
Water Research Foundation (Australia).
A. Karoly.
Water Res Found of Australia Bull No 14, 1963. 55 p, 26 fig, 5 tab.

Descriptors: *Rainfall intensity, *Precipitation (Atmospheric), *Seasonal, Mathematical studies, Statistical methods, Summer, Winter, Spring, Autumn, Hydrologic data, Duration curves, Cities.
Identifiers: *Australian rainfall intensity, Victoria.

Using Melbourne rainfall for selected duration and the daily rainfall of 50 country stations, charts have been prepared giving the rainfall intensities for each of the four seasons for a return period of one year. To obtain intensities for other return periods, the one year intensity is multiplied by a frequency factor obtained from charts giving a function of the standard deviation of the logarithms (s) for the required duration (t) and return period (T). (Gabriel-USGS)
W69-07014

THE RAINS OF AUGUST AND SEPTEMBER 1968 IN THE FRENCH ALPS (FRENCH),
Center of National Scientific Research (France).
M. F. De Saintignon, and H. Vivian.
Rev de Geogr Alpine, Grenoble, Vol 57, No 2, pp 335-360, 1969. 26 p, 3 fig, 8 plate, 2 tab.

Descriptors: *Rain, *Precipitation (Atmospheric), *Seasonal, *Autumn, Winter, Winds, Meteorological data, Air temperature, Anticyclones, Climates, Climatic zones, Maps, Frequency, Mathematical studies, Statistical methods.
Identifiers: *French Alps.

A detailed analysis of rain characteristics in the French Alps was made on the basis of precipitation data recorded at many hydrologic gaging stations for the years of 1921 to 1965, 1931-1965, and 1936 to 1965. The study shows that by comparison with the hydrologic data recorded prior to 1966, the rains of August and September of 1968 were of the highest intensity in the greater part of the Northern Alps area. The statistical analysis also shows that these rains of 1968 intensity do nor occur more than 5 to 10 times in a century. (Gabriel-USGS)

2D. Evaporation and Transpiration

QUANTITATIVE MODEL OF MOISTURE FLOW IN THE PLANT-SOIL SYSTEM,
Hydrometeorological Service of the USSR (Moscow).
For primary bibliographic entry see Field 02G.
W69-06986

AN EXPERIMENTAL STUDY OF EVAPORATION FROM UNIFORM SOIL COLUMNS IN THE PRESENCE OF A WATER TABLE,
National and Univ. Inst. of Agriculture, Rehovoth (Israel). Volcani Inst. of Agriculture Research.
A. Hadas, and D. Hillel.
Trans of 9th Int Congr of Soil Sci, Adelaide, Australia, Vol 1 of 4 vol, pp 67-74, 1968. 8 p, 3 fig, 1 tab, 13 ref.

Descriptors: *Evaporation, *Soil water movement, Water table, Water levels, Drying, Hysteresis, Salinity, Saline soils, Soil physical properties, Soil chemical properties, Permeability.
Identifiers: Potential evaporativity.

The results of laboratory experiments on evaporation from uniform profiles in the presence of a water-table are presented. Theoretical solutions describing steady-state evaporation predict that when external evaporativity is increased the soil eventually attains a maximal evaporation rate which depends upon water-table depth and profile transmissivity and which remains constant regardless of how high external evaporativity may become. Experiments showed that instead of levelling off at the maximal evaporation rate, as evaporativity was further increased the actual evaporation rates began to decrease. This may result from gradual salt accumulation, structural effects or changes in boundary conditions (i.e. the formation of a two-layer condition in which a dry surface layer eventually acts as a diffusion barrier). A comparison of the measured evaporation rates and those predicted theoretically showed that both Gardner's and Anat's theories overestimated the maximal rate, especially for shallow water-table conditions. Modification of Gardner's theory to correct for excessively high conductivity values near saturation improved the estimate somewhat. Cyclic changes in evaporativity or in water-table depth apparently induced hysteretic effects which decreased the evaporation rate.
W69-06987

RELATION OF WATER APPLICATION TO EVAPORATION AND STORAGE OF SOIL WATER,
Agricultural Research Service, Fort Collins, Colo. Soil and Water Conservation Research Div.; and Agricultural Research Service, Riverside, Calif. Soil and Water Conservation Research Div.
H. R. Gardner, and W. R. Gardner.
Soil Sci Soc Amer Proc, Vol 33, No 2, pp 192-196, Mar-Apr 1969. 5 p, 8 fig, 1 tab, 7 ref.

Descriptors: *Evaporation, *Soil water, Irrigation, Infiltration, Rainfall, Infiltrometers, Evaporators, Soil water movement, Drying, Soils, Water balance, Humidity, Water loss, Diffusion, Temperature.
Identifiers: Soil water evaporation.

Evaporation was measured from columns of Rago loam and McGrew loamy sand, to which water had been added at several rates ranging from 0.25 cm/day to 10.2 cm every 20 days. The water lost by evaporation varied from 100% of the total applied for the smallest and most frequent addition to 31.2% for the 10.2 cm of water added to McGrew soil every 20 days. The losses from repeated cycles of the individual treatments tended to approach a constant value that was less than the potential loss. As the amount added was increased for a given evaporation period, the loss tended to approach a constant value that also was much less than the potential loss. The cumulative evaporation curves were scaled to dimensionless variables and compared with a theoretical solution of the diffusivity equation for finite media. Using this scaling-comparison technique, the losses from soil with two different potential evaporations were compared with predicted curves.
W69-07089

EVAPORATION FROM BARE SOIL UNDER HIGH RADIATION CONDITIONS,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Land Research and Regional Survey.
C. W. Rose.
Trans of 9th Int Congr of Soil Sci, Adelaide, Australia, Vol 1 of 4 vol, pp 57-66, 1968. 10 p, 4 fig, 1 tab, 12 ref.

Descriptors: *Evaporation, *Soil water, *Soil water movement, Water temperature, Air temperature, Irrigation, Energy budget, Heat budget, Solar radiation, Mass transfer, Vapor pressure.
Identifiers: Evaporation from bare soil.

A theory is proposed enabling evaporation from bare soil to be calculated from measured water content and temperature profiles, provided relevant physical soil properties are determined. The theory is of general application and equates evaporation over any time period to the sum of upward liquid and vapor phase water fluxed at any depth in the soil and the decrease in water stored in the soil to that depth over the same interval. The theory is applied to data from an experiment in which profiles of water content and temperature were measured for a period of 6 days and nights following watering of bare soil by sprinkler irrigation. The mean daily shortwave radiation flux during the experiment was 617 cal/sq cm, and maximum soil temperature gradients approached 10 deg/C cm. Reasons for the somewhat complicated pattern of calculated evaporation rate are discussed, and it is shown that vapor phase transport of water is important under the conditions of this experiment. The mean ratio of evaporation by night to that of the preceding day was 0.6. One reason for this ratio being so high was the directional opposition between vapor and liquid fluxes by day and their concurrence at night. Possible errors in the calculated evaporation are considered.

2E. Streamflow and Runoff

FLOOD STAGES AND DISCHARGES FOR SMALL STREAMS IN TEXAS, 1967 WATER YEAR,
Geological Survey, Austin, Tex.
E. E. Schroeder.
Geol Surv Open-file Rep No 113, Mar 1969. 282 p, 2 fig, 4 tab, 6 ref.

LIBRARY U. OF I., URBANA-CHAMPAIGN

Descriptors: *Data collections, *Hydrologic data, *Floods, *Texas, Rainfall-runoff relationships, Discharge (Water), Stage-discharge relations, Streamflow, Small watersheds, Flow measurement, Gaging stations.
Identifiers: Flood measurements (Tex).

Flood stage and discharge data for small streams in Texas in the water year 1967 are compiled. Important floods are listed. Rainfall and inflow for significant storms at a San Antonio pumping station, and runoff and rainfall data for significant storms at 151 regularly operated gaging stations are tabulated. (Knapp-USGS)
W69-06946

WATER RESOURCES OF ANTELOPE COUNTY, NEBRASKA,
Geological Survey, Washington, D. C.
V. L. Souders, and F. B. Shaffer.
Geol Surv Hydrol Invest Atlas HA-316, 3 sheets, 1969. 18 fig, 4 map, 2 photo, 2 tab.

Descriptors: *Water resources, *Surface waters, *Groundwater, *Nebraska, Water wells, Water yield, Water quality, Transmissivity, Streamflow, Hydrographs, Duration curves, Floods, Runoff, Irrigation water, Aquifers, Alluvium.
Identifiers: *Antelope County (Neb).

The water resources of Antelope County, Nebraska are discussed in a 3-sheet hydrological Atlas consisting of maps, charts, diagrams, geologic cross sections, tables, photographs, and text. Most available water in the county is in the Ogallala aquifer of Tertiary age, consisting of alluvial material, silts, and clays. Well yields of as much as 2,000 gpm are possible in much of the county, and conditions are favorable for irrigation. Water levels have not been affected to an important extent by present pumping rates. All water in the county is of excellent quality for irrigation, and except for hardness it is suitable for all other uses. (Knapp-USGS)
W69-06976

ANALYSIS OF EMPIRICAL FORMULAS FOR THE DETERMINATION OF MAXIMUM RUNOFFS FROM SMALL MOUNTAIN BASINS (POLISH),
State Inst. of Hydrology and Meteorology, Warsaw, (Poland).
Janusz Walkowicz.
Arch Hydrotech, Vol 15, No 4, Warsaw, pp 515-553, 1968. 9 fig, 23 tab, 70 ref.

Descriptors: *Mathematical studies, *Analytical techniques, *Runoff, *High water mark, *Small watersheds, Frequency, Precipitation (Atmospheric), Slopes, Flow measurement, River basins, Altitude, Sea level.
Identifiers: *Poland, Small basin runoff, Empirical formula analysis.

This investigation develops new formulas for the determination of maximum runoffs of various frequencies from small mountain basins of 1 to 100 sq km area, at altitudes over 500 m. Stream courses vary in length from 1 to 25 km, annual precipitation varies from 700 to 1500 mm, and values for the mean water-course slope range from 0.021 to 0.1. These new formulas were developed on the basis of the analysis of the formulas pertaining to the evaluation of maximum annual discharges commonly used in Poland and abroad. The formulas developed by the author were applied to the hydrological data recorded at the gaging stations on the Bober River (Poland) and the Vistula River and gave satisfactory results. (Gabriel-USGS)
W69-07010

WATER RESOURCES OF THE MISSISSIPPI HEADWATERS WATERSHED, NORTH-CENTRAL MINNESOTA,
Geological Survey, Washington, D. C.
E. L. Oakes, and L. E. Bidwell.
Geol Surv Hydrol Invest Atlas, HA-278, 4 sheets, 1968. Test, 37 fig, 4 map, 8 tab, 8 ref.

Descriptors: *Water resources, *Groundwater, *Surface waters, *Minnesota, Mississippi River, Streamflow, Water yield, Runoff, Evaporation, Water quality, Hardness (Water), Recreation, Fishing, Floods, Duration curves, Hydrographs, Hydrologic data, Aquifers, Water wells.
Identifiers: Mississippi Headwaters Watershed (Minn).

The water resources of the Mississippi Headwaters watershed, Minnesota, are discussed in a 4-sheet Hydrologic Atlas consisting of maps, charts, diagrams, tables, and text. The groundwater reservoir contains the largest quantity of water available in the area. Well yields of as much as 500 gpm are possible in most of the area. The best aquifers are buried outwash deposits. Saturated thicknesses range from less than 50 ft to over 500 ft. Water hardness ranges from 68 to 700 mg/1, and all groundwater in the area is suitable for irrigation. Surface water is abundant and not subject to large variations in flow. Average runoff is about 5.3 inches. Evaporation is about 27 inches. Facilities for year-round water-based recreation are excellent. (Knapp-USGS)

WATER RESOURCES OF MEXICO,
Mexico National Univ, Mexico City. Instituto de Geofisica.
Rodolfo C. del Arenal.
Water Resources Bull, Vol 5, No 1, pp 19-38, Mar 1969. 20 p, 9 fig, 3 tab, 14 ref.

Descriptors: *Water resources, *Water resources development, *Surveys, Water utilization, Water supply, Precipitation (Atmospheric), Water demand, Population, Climates, Water management (Applied), Water policy.
Identifiers: *Mexico, Water resources distribution.

A general review of Mexico's water resources is presented. In Mexico, the areas of greatest water demand are generally semiarid to arid, while in areas of abundant water, population and demand are low. Irrigation is required for profitable agriculture in nearly one-half the area of the country. Water availability and water demand are shown by maps. Water availability, population densities, and storage-dam data are tabulated. Present and suggested water policies are briefly discussed. (Knapp-USGS)

GENERAL CHARACTERISTICS OF VENEZUELAN RIVERS (FRENCH),
Instituto de Geografia y Conservacion de Recursos Naturales, Merida (Venezuela).
Pierre Perrin.
Rev de Geogr Alpine, Grenoble, Vol 57, No 2, pp 387-404, 1969. 18 p, 6 fig, 8 ref.

Descriptors: *Rivers, *Hydrologic properties, *Topography, Precipitation (Atmospheric), Discharge (Water), High water mark, Low water mark, River basins, Water level fluctuations, Snowfall, Winds, Floods, Seasonal, Anticyclones, Streamflow, Gaging stations.
Identifiers: *Venezuelian river characteristics.

General characteristics of Venezuelian rivers were analyzed on the basis of hydrogeological and geographical data recorded at gaging stations located in the river basins of Venezuela. The analysis shows that the Venezuelian rivers are strongly affected by tropical rains and topographic relief which determines atmospheric circulation. The results of this topographical relief are that the greater river discharges are associated with the rivers issuing from the Andes mountains and Guiana with their river courses passing through very populated areas of desert character. Under these unfavorable climatic conditions often associated with the effects of anticyclones, a problem of sufficient water supply for domestic and industrial use is of foremost importance and is difficult to resolve. DETERMINATION OF HYDROGEOLOGICAL PARAMETERS UNDER THE CONDITIONS OF MUTUAL INTERACTION OF WATER-BEARING HORIZONS (RUSSIAN),
Moscow State Univ. (USSR). Hydrogeological Section.
I. S. Pashovsky.
Moscow Univ Herold, Ser 4, Geol, No 2, pp 100-103, Mar-Apr 1969. 4 p, 2 fig, 5 ref.

Descriptors: *Parametric hydrology, *Aquifers, *Integral circuits, Geology, Sands, Conglomerate rocks, Clays, Marl, Filtration, Density, Water balance, Fissures (Geology), Sedimentary rocks, Boreholes, Pumping, Pressure.
Identifiers: *USSR, Aquifer hydrogeologic parameters, Cisaralian area.

Hydrogeological parameters of hydraulically-associated aquifers were analyzed analytically and experimentally using laboratory models and hydrological and borehole data recorded in the Cisaralian area of the USSR. The filtration coefficients of the aquifers of the Cisaralian area were determined as varying from 0.0001 to 0.0008 m/day. The study shows that the Cisaralian coefficient values determine the mean values characterizing the total area affected by the presence of boreholes and can not be taken as representing the filtration coefficients of the clays separating the water-bearing horizons. (Gabriel-USGS)

THE STATUS OF GEOHYDROLOGY IN INDIA,
Geological Survey of India.
G. C. Chaterji.
Water Resources Bull, Vol 5, No 1, pp 3-18, Mar 1969. 16 p, 2 fig, 2 tab.

Descriptors: *Hydrogeology, *Surveys, Groundwater, Surface waters, Aquifers, Test holes, Irrigation, Industrial water, Irrigation water, Municipal water, Water resources development.
Identifiers: *India, Groundwater investigations.

Groundwater investigations have formed a part of the regular activities of the Geological Survey of India since its inception in 1851. Until 1930, such studies were restricted mostly to problems of rural and urban water-supply. Systematic regional geohydrological studies began in the year 1953. During the period 1953-1959 systematic hydrologic studies in India aided by drilling and testing covered about 1.5 million sq km of unconsolidated to semi-consolidated sediments, mostly in the major sedimentary basins and coastal plains. These studies revealed groundwater reservoir formations as old as the Jurassic. Since 1961 these studies have been supplemented with regional groundwater studies in extensive areas of the soft-rock mantle and also in some of the hard-rock areas. Another 70,000 sq km was covered by 1961. Basin-wide groundwater assessment, exploitation planning and conservation were the primary objectives of these studies. Currently, systematic geohydrological investigations are being continued in all the basins simultaneously with studies into specific water-supply problems for industry and agriculture. Of particular importance are those involving lignite mining operations, seepage from reservoirs into coal mines, reservoir leakage problems, effects of large-scale irrigation on groundwater regime and the fresh-saline water interface in coastal areas. The nature and origin of the thermal springs of India are also being studied intensively. Conventional geophysical methods have been applied widely to estimate thickness of sediments, delineate water-bearing zones, and detect saline water-bearing formations.

KARSTIC HYDROLOGY OF VERCORS (FRENCH),
Jean Loup.
Rev de Geogr Alpine, Grenoble, Vol 57, No 2, pp 329-332, 1969. 4 p.

Descriptors: *Hydrologic properties, *Karst, *Aquifers, Groundwater movement, River basins, Caves, Dye releases, Hydrogeology, Water resources, Pollutants, Chemical analysis, Hydroelectric power, Topography, Rain, Lakes, Water balance, Discharge (Water).
Identifiers: *Vercors, France, Karstic hydrology.

Hydrogeological characteristics of the Vercors, France, karstic area are broadly discussed on the basis of the geological, geographical and hydrological data recorded in 1968. The study shows that the Vercors massif has a weak capacity for water retention in spite of the presence of large numbers of cavities and underground channels in the area. The effect of aquifers is noticeable during the dry years only, and it is probable that these aquifers are fed by snowmelts and rainstorms of considerable intensity. (Gabriel-USGS)

AVAILABLE AND ACCESSIBLE WATER,
Rothamsted Experimental Station, Harpenden (England).
H. L. Penman.
Trans of 9th Int Congr of Soil Sci, Adelaide, Australia, Vol 1 of 4 vol, pp 29-37, 1968. 9 p, 2 fig, 6 ref.

Descriptors: *Soil water movement, *Soil-water-plant relationships, *Evapotranspiration, Diffusion, Diffusivity, Moisture, Plant growth, Root systems, Water balance.
Identifiers: Drying, Water availability.

Measurements on a loam soil gave a diffusivity ranging from 20 sq cm/day at the wilting point to 200 sq cm/day near field capacity. Starting with these data, transfer rates are calculated for a complete crop cover on such a soil, with the root system arranged in parallel sheets 40 cm deep at 2 spacings, 2 and 20 cm, with and without a deep subsoil, for 2 imposed rates of potential evaporation, 0.2 and 0.6 cm/day, and with all further resistance either wholly in the atmosphere or all in the plant. Drastic mathematical and physical assumptions are necessary. Results are curves of accumulated actual evaporation, against accumulated potential evaporation. The curves vary as greatly as published field experience. The main results are: (1) the larger potential evaporation, the smaller the value of total potential evaporation at which total actual evaporation becomes less than total potential evaporation; (2) at close spacing (dense root system) it is immaterial whether the external resistance is in the plant or in the atmosphere, but at wide spacing plant resistance (if any) can cause an early check to transpiration; (3) when there is no subsoil, the Veihmeyer concept is very nearly exact, particularly at the lower rate of potential evaporation.

ON THE WATER BALANCE OF GRASSLAND AND FOREST,
Commonwealth Scientific and Industrial Research Organization, Adelaide (Australia). Div. of Soils.
J. W. Holmes, and J. S. Colville.
Trans of 9th Int Congr of Soil Sci, Adelaide, Australia, Vol 1 of 4 vol, pp 39-46, 1968. 8 p, 3 fig, 3 tab, 6 ref.

Descriptors: *Forests, *Grasslands, *Water balance, *Hydrologic budget, *Soil-water-plant relationships, Evapotranspiration, Rainfall, Moisture stress, Recharge, Surface-groundwater relationships, Aquifers.
Identifiers: Australia.

Lysimeters were used for the measurement of drainage through the soil profile and the neutron moisture meter was used for the measurement of soil water content and estimation of drainage to study the water balance of grassland and forest in a region enjoying 700 mm annual rainfall. Recharge to water-table aquifer was 60 mm per year under grassland and zero under forest. Evaporation during winter and spring, which is the growing season

free from soil water stress, was greater from forest than it was from grassland by a factor of about 2. Increment of soil water during the same season was typically about 230 mm in the soil profile beneath grassland and about 120 mm in the soil profile beneath forest.
W69-06985

QUANTITATIVE MODEL OF MOISTURE FLOW IN THE PLANT-SOIL SYSTEM,
Hydrometeorological Service of the USSR (Moscow).
I. I. Sudnitzin.
Trans of 9th Int Congr of Soil Sci, Adelaide, Australia, Vol 1 of 4 vol, pp 47-55, 1968. 9 p, 2 fig, 9 ref.

Descriptors: *Soil-water-plant relationships, *Soil water movement, Moisture stress, Diffusion, Water pressure, Osmotic pressure, Evapotranspiration, Transpiration, Water balance, Mathematical models.
Identifiers: Potential evapotranspiration.

A quantitative model of water movement in the soil-plant-atmosphere system is presented. The model was based on thermodynamical principles postulating the linear relationship between flux density and the potential gradient, the relationship between the hydraulic conductivity and the total soil water pressure, obtained on the basis of soil pore size distribution, and the relationship between relative transpiration and the total soil water pressure, estimated empirically in a pot experiment and confirmed by analyzing the meteorological data for many years. By this model it is possible to calculate the relationship between the water pressure in the plant roots and the soil water pressure, if the potential evapotranspiration, active root surface and some constants are known. The experimental control confirms the validity of this model as a first approximation. It appears that in the range of 0 to -15 bar, root pressure decreases more rapidly than soil water pressure and thus the water pressure head between roots and soil increases uninterruptedly. When soil water pressure becomes small, the leaf surface area becomes smaller by leaf shedding (the range of 'passive' adaptation). At a soil water pressure of -25 bar, the root to soil pressure difference becomes very small, the water flux density also becomes very small and plants die. Under given meteorological conditions the value of the pressure difference is proportional to the potential evapotranspiration.

THE EFFECT OF TEMPERATURE GRADIENT ON MOVEMENT OF SOIL WATER,
Slovak Academy of Sciences, Bratislava (Czechoslovakia). Inst. of Hydrology and Hydraulics.
J. Sutor, and V. Novak.
Trans of 9th Int Congr of Soil Sci, Adelaide, Australia, Vol 1 of 4 vol, pp 85-93, 1968. 9 p, 4 fig, 15 ref.

Descriptors: *Evaporation, *Soil water movement, *Soil water, Temperature, Drying, Diffusion, Percolation, Heat flow, Mass transfer, Thermal stress, Moisture stress, Thermodynamics.
Identifiers: Thermal gradients, Moisture gradients.

The influence of a temperature gradient within a soil column upon the loss of water from the exposed surface of one end was investigated experimentally using a packed column 15 cm long. The surface was maintained cooler than the soil beneath it, and a set of water content profiles in the soil was obtained for the conditions; initial water content of the soil 0.21 cc per cc, temperature gradient 1 deg C/cm, mean temperature 29 deg C, bulk density of the soil 1.20 g/cc and 7 relative vapor pressures at the evaporating surface between 0.01 and 1.0. Similar experiments were performed with isothermal water movement in the soil. The evaporation was about 3 times as large, when the temperature gradient assisted the flow of water to the surface. By computation, using the experimentally determined values of temperature gradient and water flux, the coefficient for water flow under a temperature gradient was determined to be about .00003 sq cm/sec deg C with a maximum content of 0.21 cm per cm.
W69-06988

THE SIGNIFICANCE OF THE EXTERNAL WATER POTENTIAL AND OF SALT TRANSPORT TO WATER RELATIONS IN PLANTS,
California Univ., Riverside. Dept. of Soils and Plant Nutrition.
J. J. Oertli.
Trans of 9th Int Congr of Soil Sci, Adelaide, Australia, Vol 1 of 4 vol, pp 95-107, 1968. 13 p, 6 fig, 1 tab, 18 ref.

Descriptors: *Soil-water-plant relationships, *Soil water movement, *Plants, Moisture stress, Thermodynamics, Thermodynamic behavior, Free energy, Chemical potential, Solutes, Osmotic pressure, Mass transfer, Salinity.
Identifiers: Water potential.

Effects of the external water potential and of solute-water interactions on plant behavior were investigated. Maintenance of turgor pressure in plants grown in external solutions of different osmolalities does not preclude a growth reduction under saline conditions through an effect of water relations. Through solute uptake, elongating cells must continuously adjust the turgor pressure in the volume they are gaining. From salt transport characteristics, an optimum concentration may be predicted at which this adjustment is most rapid. Toward both lower and higher saline concentrations, growth rates through cell elongation are reduced. It is shown that salt depletion or accumulation during xylar water flow changes requirements for osmotic adjustment in plants. It is postulated that salt burns may be the result of such an extracellular salt accumulation. Conversely extracellular salt depletion should have a beneficial effect. These changes of foliar extracellular salt concentrations are not properly considered when the osmolality of the expressed leaf sap is used to test a possible turgor adjustment. It is concluded that plant responses to saline conditions can only partly be explained by the energy status of the external water and that static and dynamic aspects of solutes in plants, both intra- and extracellular must properly be considered.
W69-06989

THE USE OF EXCHANGE ISOTHERMS TO DETERMINE DIFFUSION COEFFICIENTS IN SOIL,
Oxford Univ. (England). Soil Science Lab.
P. H. Nye.
Trans of 9th Int Congr of Soil Sci, Adelaide, Australia, Vol 1 of 4 vol, pp 117-126, 1968. 10 p, 3 fig, 19 ref.

Descriptors: *Diffusion, *Soil water movement, *Solutes, *Ion transport, Mass transfer, Diffusivity, Ion exchange, Leaching, Soil chemical properties.
Identifiers: Exchange isotherms, Chemical potential gradients, Concentration gradients.

Theories of the conductivity of heterogeneous materials may be used to derive concentration dependent differential diffusion coefficients of ions in soils and clays in terms of their mobility on the solid and in the liquid. In practice, for K, Na, H, Sr and phsophate, only a small error is made by assuming that these ions are mobile in the solution. The diffusion coefficients then depend mainly on the slope of the exchange isotherm and on the soil moisture content, which controls the impedance factor. In evaluating the slope of the exchange isotherm, the exchanging ion, the total solution concentration, and the possibility of indefinite equilibration must be considered. Impedance factors for gas diffusion and ion diffusion are fairly similar. It should prove easier to obtain differential diffusion coefficients from the slopes of isotherms and the moisture content than to measure them directly.

LYSIMETRIC OBSERVATIONS ON THE LEACHING OF ELEMENTS IN PODZOLIC SOILS,
Dokuchayev Central Soil Museum, Leningrad (USSR).
V. V. Ponomareva, T. A. Rozhnova, and N. S. Sotnikova.
Trans of 9th Int Congr of Soil Sci, Adelaide, Australia, Vol 1 of 4 vol, pp 155-164, 1968. 10 p, 1 fig, 3 tab, 6 ref.

Descriptors: *Leaching, *Podzols, *Lysimeters, Water quality, Water chemistry, Humid climates, Forests, Forest soils, Trees, Infiltration, Solutes, Sorption, Ion exchange.
Identifiers: Forest floor.

The composition of lysimeter water from different genetic horizons of a sandy illuvial humus polzol and a soddy podzolic loamy soil, both from the Leningrad region, was studied. The amounts of some nutrient elements leaching from the litter of the podzol were negligible, being of the same order as the amounts entering the soil from the atmosphere. The leaching of the same elements from the litter of the soddy podzolic soil was greater. The predominant amounts of the elements leached were retained by the A-1 horizon. This phenomenon may be related both to the formation of the A-1 horizon under the A-0 horizon and the A-2 horizon under the A-1 horizon in the soddy podzolic soil profiles. Almost all elements entering the A-1 horizons of the soddy podzolic soil were retained there, varying from 20 to 80% retention. Most elements were leached from the A-2 horizon in greater amounts than that of their entry from the A-1 horizon; this was evidence of the current podolizing process. The transitional A-2 B horizon should be regarded as the horizon of most active podzolization due to the high amount of silicate mineral elements being leached from it. Desilication, together with iron and aluminum retention, were characteristics of the B Horizon of the soddy podzolic soil. On the other hand the sandy podzol was characterized by different features of element migration and accumulation from solution.

HYDROLOGICAL PROFILE OF THE SOIL,
AKADEMIYA Nauk SSSR, Moscow. Pochvennyi Institut.
A. A. Rode.
Trans of 9th Int Congr of Soil Sci, Adelaide, Australia, Vol 1 of 4 vol, pp 165-172, 1968. 8 p, 4 fig, 1 tab, 4 ref.

Descriptors: *Soil moisture, *Soil water movement, *Soil-water-plant relationships, Infiltration, Drying, Percolation, Moisture availability, Moisture tension, Drainage, Water table, Zone of aeration, Root zone.
Identifiers: Soil water horizons, Soil hydrological horizons.

Soil water is not evenly distributed, but occurs in distinguishable horizons. Soil water mobility is distinctly different in each horizon, and it may be described by 4 water-content parameters: (1) total capacity; (2) minimum retention capacity; (3) capillary bond rupture content; and (4) wilting point content. A soil hydrological horizon is defined as a zone with a definite mobility, based on these 4 parameters. The 7 horizons described are: total capacity (1); capillary saturation (between 1 and 2); minimal saturation (2); weak desiccation (between 2 and 3); intensive desiccation (between 3 and 4); total biological desiccation (4); and physical desiccation (less than 4). Soil moisture profiles of solonchak-solonetz, southern chernozem, and derno-podzolic soils are used as illustrations. Wetting and drying do not proceed uniformly with depth and time, but hydrological horizons fill with water or dry one at a time. (Knapp-USGS)
W69-06994

BINGHAM FLOW IN CAPILLARY-POROUS MEDIA,
Agrofizicheskii Nauchno-Issledovateiskii Institut, Leningrad (USSR).
N. P. Bondarenko.
Trans of 9th Int Congr of Soil Sci, Adelaide, Australia, Vol 1 of 4 vol, pp 205-212, 1968. 8 p, 2 fig, 2 tab, 7 ref.

Descriptors: *Soil water movement, *Rheology, *Plasticity, *Hydrogen bonding, *Capillary action, Darcy's law, Porous media, Water properties, Water structure.
Identifiers: Non-Newtonian flow, Hydrogen-bonded liquids, Buckingham-Reiner equation, Bingham flow.

Cappillary-flow experiments run at low pressure gradients in quartz and glass tubes show that the flow velocity of some pure hydrogen-bonded liquids such as water, alcohol, etc., is not proportional to the gradient. Such liquids are strictly non-Newtonian, with plastic viscosities of the order of 0.01 to 0.001 dynes/sq cm. Capillary flow of these liquids may be described by the Buckingham-Reiner equation. The flow of liquids without hydrogen bonds is Newtonian. For hydrogen-bonded liquids, Darcy's law is not generally valid. (Knapp-USGS)
W69-06995

SOLUTE AND SOLVENT FLOW AS INFLUENCED AND COUPLED BY SURFACE REACTIONS,
Colorado State Univ., Fort Collins; Agricultural Research Service, Washington, D. C.; and California Univ., Riverside.
W. D. Kemper and J. Letey.
Trans of 9th Int Congr of Soil Sci, Adelaide, Australia, Vol 1 of 4 vol, pp 233-241, 1968. 9 p, 1 fig, 10 ref, 1 append.

Descriptors: *Soil water movement, *Aqueous solutions, *Porous media, *Sorption, Clays, Ion exchange, Ion transport, Osmosis, Electrolytes, Solutes, Salts, Thermodynamics, Mathematical models, Hydraulic conductivity, Filtration.
Identifiers: Surface chemistry.

The influence of surface-reactions on the flow of solutions through porous media is analyzed mathematically. Temperature gradients caused by viscous dissipation of energy are not large enough to invalidate the approximation of isothermal flow in the analysis. The Onsager reciprocal relationship holds approximately. Soil-solute interactions are determined by adsorption and hydrodynamic factors and not by geometrical factors. (Knapp-USGS)
W69-06996

THE SIMULTANEOUS FLOW OF WATER AND HEAT OR SOLUTES THROUGH SOIL,
Utah State Univ., Logan. Dept. of Soils and Meteorology.
A. Hadas, and S. A. Taylor.
Trans of 9th Int Congr of Soil Sci, Adelaide, Australia, Vol 1 of 4 vol, pp 243-251, 1968. 9 p, 1 fig, 2 tab, 18 ref, 1 append.

Descriptors: *Ion transport, *Soil water movement, *Mathematical models, Thermodynamics, Mass transfer, Heat flow, Aqueous solutions, Energy transfer, Equilibrium, Heat transfer.
Identifiers: Irreversible thermodynamics.

A mathematical model uses nonlinear equations to describe the simultaneous flow of water, heat, and solutes through soil, in response to thermal, pressure, and chemical gradients. Solutions obtained with the model were compared with experimental data and were found not to explain real behavior. The discrepancies may be in the assumptions of transport mechanisms or in the validity of the irreversible thermodynamic processes used in the model. The amount of disequilibrium of the real system that may be represented in the mathematical model also has an unknown effect. Despite these problems, the thermodynamic approach appears to be a promising field for further work. (Knapp-USGS)
W69-06997

NON-LINEAR THERMODYNAMICS OF IRREVERSIBLE PROCESSES APPLIED TO SOIL-WATER SYSTEMS,
Punjab Agricultural Univ., Hissar, (India).
R. C. Srivastava, and I. P. Abrol.
Trans of 9th Int Congr of Soil Sci, Adelaide, Australia, Vol 1 of 4 vol, pp 253-262, 1968. 10 p, 21 ref.

Descriptors: *Soil water movement, *Ion transport, *Heat flow, Mathematical models, Thermodynamics, Mass transfer, Aqueous solutions, Energy transfer, Equilibrium.
Identifiers: Irreversible thermodynamics.

An attempt was made to arrive at a generalized theory of transport processes in soil systems by taking into account the non-linear phenomenological relations and also the higher order symmetry relations in addition to Onsager's reciprocal relations. Interrelated rate equations for the transport of matter and energy through soil systems in the non-linear region were obtained. Methods for evaluating the additional phenomenological coefficients occurring in the non-linear rate equations are outlined in principle so that these non-linear phenomenological equations may have a predictive value. Generalized equation for the flow of water through soils which reduces to Darcy's law in the linear region has been shown to be a consequence of such a treatment. The generalized flow equation thus obtained is in agreement with the empirical finding of earlier workers. An attempt was made to work out the transport of water through soils under the influence of temperature gradients. Generalized rate equations for thermally driven water through soils were obtained, and reduce to those derived by Cary and Taylor in the linear region.
W69-06998

A STUDY OF WATER MOVEMENT TOWARDS THE DRYING ZONE DEPENDING ON SOIL CONDITIONS,
Agrofizicheskii Nauchno-Issledovatelskii Institut, Leningrad (USSR).
N. A. Sokolovskays, I. B. Revut, and S. V. Nerpin.
Trans of 9th Int Congr of Soil Sci, Adelaide, Australia, Vol 1 of 4 vol, pp 263-271, 1968. 9 p, 3 fig, 1 tab, 8 ref.

Descriptors: *Soil water movement, *Drying, *Soil-water-plant relationships, Permeameters, Hydraulic models, Moisture stress, Capillary action, Root zone, Soil moisture, Soil physical properties, Soil structure.
Identifiers: Water tension.

Infiltration apparatus was constructed to study water movement in soil samples of different particle size, structural composition and density. It allows measurement of soil water tension while water moves to a drying zone created with a filter through which the necessary suction is maintained. This apparatus has been used for studying water movement in structured soils. Tension isopleths of soil water were obtained for undispersed samples of a well structured deep clay-loam chernozem, and for fractions of different size. These allowed consideration of the process of water movement to the consumption zone in a structured soil. It is established that with soil water reduction below field capacity, regular water movement to the consumption zone is observed in pores of 60-15 micron. When water moves in smaller pores, gradual capillary bond rupture occurs first in larger pores and then in smaller ones. Water bonds between soil aggregates in a deep clay-loam chernozem remain up to pF of 2.6. Capillary bond rupture in pores of 7-5 micron results in the breaking of water bonds between aggregates. Moisture content at capillary bond rupture (MCR) in the soil considered was 32% of dry weight.
W69-06999

FACTORS DETERMINING THE HYDRAULIC CONDUCTIVITY OF RED MEDITERRANEAN SOILS AND DERIVED TYPES,
Water Planning for Israel Ltd., Tel-Aviv.
J. E. Berend, and S. Kary.
Trans of 9th Int Congr of Soil Sci, Adelaide, Australia, Vol 1 of 4 vol, pp 273-282, 1968. 10 p, 1 fig, 2 tab, 9 ref.

Descriptors: *Soil water movement, *Hydraulic conductivity, *Soil types, *Infiltration, Irrigation, Water spreading, Leaching, Soil physical properties, Soil chemical properties, Clays, Artificial recharge, Drying, Water reuse.
Identifiers: *Israel, *Red Mediterranean soils, Pseudogley, Hamra soils, Soil reclamation.

The hydraulic characteristics of Red Mediterranean ('Hamra') soils, and the pseudogley ('Nazzaz') soils derived from them were investigated, using test infiltration ponds up to 1 ha area. Two typical situations were encountered, namely the normal soil profile and a soil profile which had been covered by dune sand. The red soils are invariably very permeable. The pseudogleys are much less pervious. The exchange complex is dominated by Ca and Mg carbonates, which are completely leached only from exposed soils. Leaching water tended to dissolve alkaline-earth carbonates from the uppermost layer of the soil profile which became clogged after the exhaustion of the carbonate reserves. The accelerated illuviation leading to pseudogley formation does not occur under dunes, which prevent extreme drying and cracking. Therefore, the deterioration into pseudogley is assumed to pre-date the dune invasion. Some increase in permeability of the underlying soil occurred with leaching of alkaline-earth carbonates from the invading dunes. This process, probably lasting for hundreds of years, improved the structure of the underlying soil and increased the hydraulic conductivity up to 100-fold. The findings indicate that the correct management of water-spreading grounds involves replenishing the carbonate content and avoiding accelerated illuviation in soils not covered with sand dunes. Liming should be an essential step in the reclamation of the pseudogley described here.

SOIL AND SALINITY FACTORS IN IRRIGATION AND DRAINAGE OF MALLEE LANDS,
Commonwealth Scientific and Industrial Research Organization, Melbourne (Australia).
F. Penman.
Trans of 9th Int Congr of Soil Sci, Adelaide, Australia, Vol 1 of 4 vol, pp 415-423, 1968. 9 p, 3 tab, 24 ref.

Descriptors: *Irrigation water, *Water quality, *Salinity, *Drainage, *Saline soils, Leaching, Soil chemical properties, Soil physical properties, Permeability, Hydraulic conductivity, Soil types, Soil structure, Clays, Sands, Infiltration, Waterlogging.
Identifiers: *Australia, Mallee Soils (NSW), Sodium hazard.

With dune and swale topography and catenal sequences from very light soils on ridges to heavy soils on flats, Australian Mallee soils under irrigation are specially subject to problems of water logging and salinity. Minor problems associated with the saline-sodic soils are depressed availability of zinc and iron to plants and the presence of potentially toxic concentrations of water-soluble boron. Artificial under-drainage, mostly by agricultural tile, has alleviated the major problems of excess soil water and toxic salinity and also that of boron toxicity. Removal of water-soluble boron by leaching these soils is however a slow process. Zinc deficiency in such crops as citrus and vines is controlled by application of zinc compounds to the plants. High-alkalinity chlorosis due to iron deficiency is best controlled by application to the soil of a particular type of chelated iron. There is still much scope for improvement in irrigation practice to minimize overloading of drainage systems. Necessary steps include separate handling of light land, preferably by sprinkler irrigation of length of irrigation run and use of larger flows is indicated. Especially for the first 2 irrigations in the spring, running of watering furrows directly above drainage trenches should be avoided.

INTERDEPENDENCE OF WATER DROP ENERGY AND CLOD SIZE ON INFILTRATION AND CLOD STABILITY,
Agricultural Research Service, Iowa City, Iowa; Iowa Agricultural and Home Economics Experiment Station, Ames; and Colorado Agricultural Experiment Station, Fort Collins.
W. D. Moldenhauer, and W. D. Kemper.
Soil Sci Soc Amer Proc, Vol 33, No 2, pp 297-301, Mar-Apr 1969. 5 p, 8 fig, 3 tab, 17 ref.

Descriptors: *Infiltration, *Impact (Rainfall), Pudding, *Soil structure, Soil strength, Soil surfaces, Soil texture, Runoff, Erosion, Permeability.
Identifiers: Raindrop energy, Clod stability.

The decline of intake rates with successive increments of applied water drop energy in various sizes of soil fragments of 2 Iowa and 2 Colorado soil types was studied. There was a wide spread between intake rate of the 8- to 20-mm size range and those of all other sizes after the first increment (1.25 cm as 5-mm drops) was applied. The intake rate of the 8- to 20mm size declined rapidly after the first or second increment. Final intake rates were not correlated with aggregate stability. There was a negative correlation between clay content and final intake rates. Final intake rates after disintegration of large soil fragments in many cases were lower than when initial size ranges were small.
W69-07091

HEXADECANOL IN SOIL- ITS LOCATIONAL STABILITY AND INFLUENCE ON MODULUS OF RUPTURE,
Arizona Agricultural Experiment Station, Tucson; and Arizona Univ., Tucson. Dept. of Agricultural Chemistry and Soils.
Matts A. Myhrman, and D. D. Evans.
Soil Sci Soc Amer Proc, Vol 33, No 2, pp 203-205, Mar- Apr 1969. 3 p, 2 tab, 9 ref.

Descriptors: *Soil structure, *Soil amendments, *Hexadecanol, *Soil water movement, Soil aggregates, Soil texture, Soil treatment, Soil chemical properties, Soil physical properties, Permeability, Soil management, Soil strength.
Identifiers: Hexadecanol in soil.

Modulus of rupture was reduced 65% for a sandy loam soil and 57% for a silt loam soil by addition of 0.4% (by weight) dry powdered hexadecanol. Emulsified hexadecanol, powdered commercial tallow alcohol, and smaller dosages had less effect. Less than 2% of the C-14 tagged hexadecanol placed in a 1-cm thick layer of sandy soil moved under either saturated or unsaturated flow conditions. Movement probably took place in the form of small buoyant particles.

SOME ASPECTS OF TWO-DIMENSIONAL INFILTRATION,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Land Research and Regional Survey.
A. J. Peck, and T. Talsma.
Trans of 9th Int Congr of Soil Sci, Adelaide, Australia, Vol 1 of 4 vol, pp 11-12, 1968. 11 p, 2 fig, 3 tab, 12 ref.

Descriptors: *Soil water movement, *Infiltration, *Diffusion, Irrigation, Unsaturated flow, Capillary action, Percolation, Unsteady flow, Soil physical properties, Mathematical studies, Furrow irrigation.
Identifiers: Gravity effects (Infiltration).

Experiments on infiltration from a horizontal semicylindrical furrow into several soils and other porous media have provided data to test recently proposed approximate solutions for the cumulative infiltration. Within the limits of possible experimental errors, the theories appear to be adequate, but in the case where two are applicable it is not possible to say which is the better. The effects of gravity are less important in furrow than in one-dimensional infiltration because of the concentrated flux of water in soil close to the furrow. After an initial period, and before gravity is important, the infiltration rate from a furrow is nearly, but never quite, constant. Gravity effects further reduce changes of infiltration rate. In a comparison of media with very different pore size-distributions, gravity effects on cumulative infiltration were greater in the less permeable material. This behaviour is not expected of scaled media with similar pore-size distributions.

APPLICATION OF NON-LINEAR EQUATION OF UNSTEADY WATER FLOW IN SOILS,
Agrofizicheskii Nauchno-Issledovatelskii Institut, Leningrad (USSR).
S. W. Nerpin, G. I. Jusefowitsch, and W. A. Jangarber.
Trans of 9th Int Congr of Soil Sci, Adelaide, Australia, Vol 1 of 4 vol, pp 23-28, 1968. 6 p, 1 fig, 1 tab, 6 ref.

Descriptors: *Soil water movement, *Unsteady flow, *Unsaturated flow, *Mathematical models, Computer programs, Percolation, Irrigation, Infiltration.
Identifiers: Finite-difference methods.

A non-linear equation is presented for a description of water flow in soils in the non-steady state and some theoretical questions are discussed concerning the problems of boundary values of such an equation. The uniqueness of the soltuion of the first problem of boundary values is proved. A family of finite-difference equations for the numerical solution of the problem with boundary values has been established. Using a digital computer, the influence of the coefficient A on the solution of the above mentioned problem has been investigated. If A is a stepwise function of the depth x, then the calculated moisture profiles agree reasonable with the experimental data.

SOME EFFECTS OF DRAG ON THE STRUCTURE AND HYDRAULIC CONDUCTIVITY OF SOIL,
Commonwealth Scientific and Industrial Research Organization, Adelaide (Australia). Div. of Soils.
T. J. Marshall.
Trans of 9th Int Congr of Soil Sci, Adelaide, Australia, Vol 1 of 4 vol, pp 213-221, 1968. 9 p, 2 fig, 2 tab, 11 ref.

Descriptors: *Soil water movement, *Soil structures, *Hydraulic conductivity, Hydraulic models, Permeameters, Cohesive soils, Hydraulics, Fluid mechanics, Pores, Porous media.
Identifiers: Hydraulic drag.

When water flows through a bed of unstable material, the hydraulic conductivity can be affected by detachment of particles or by a change in volume of the material. These two consequences of drag are related respectively to hydraulic gradient at any given position in the bed and to the loss in head between the surface of the bed and that position. The bulk density of 2 columns of artificially packed soil increased and the hydraulic conductivity decreased with increasing head of water during downward flow. Within the columns, bulk density decreased and conductivity increased with height. The effective stress arising from drag and overburden of particles is discussed in relation to laboratory measurements of conductivity when these have to be made on easily deformable material. Although conductivity of the columns was greatly reduced after each increase of head, it otherwise changed little with time. This is ascribed to the measures taken to control detachment and the other possible causes of changing conductivity.

THE ACHIEVEMENTS OF DRAINAGE THEORY IN RELATION TO PRACTICAL NEEDS: TAKING STOCK,
Agricultural Research Council, Cambridge (England). Unit of Soil Physics.
E. C. Childs.
Trans of 9th Int Congr of Soil Sci, Adelaide, Australia, Vol 1 of 4 vol, pp 349-356, 1968. 8 p, 23 ref.

Descriptors: *Drainage, *Subsurface drainage, *Drainage systems, *Soil water movement, Hydraulic conductivity, Dupuit-Forchheimer theory, Groundwater movement, Steady flow, Unsteady flow, Saturated flow, Unsaturated flow, Digital computers, Mathematical models.
Identifiers: Drainage theory (Review).

During the last 30 years drainage theory has developed more rapidly than its application, and until this lack of balance is corrected further advances must be somewhat academic. Application needs advances in the estimation of soil parameters and interpretation of agricultural need in terms of physical requirements. But even now an understanding of theory helps the consultant to make broad conclusions about large scale land reclamation projects. For example, in the project at Lake Mariyut in Northern Egypt, it has been possible to forecast a steady water table under irrigation in spite of seasonal fluctuations of intensity of application, and limits between which that water table will eventually lie. Furthermore it has been possible to suggest a program of water-table observations during the early years of undrained irrigation which will give information as to the depth of any impermeable layer which may be present, and thus to assess where, between the estimated limits, the water table lie.
W69-07143

MELIORATIVE EFFECT OF DIRECT ELECTRIC CURRENT ON LEACHING SOLONCHAKOUS SOLONETZ,
Moscow State Univ. (USSR). Faculty of Biology and Soil.
A. F. Vadyunina.
Trans of 9th Int Congr of Soil Sci, Adelaide, Australia, Vol 1 of 4 vol, pp 455-463, 1968. 9 p, 2 fig, 3 tab, 9 ref.

Descriptors: *Saline soils, *Leaching, *Electro-osmosis, *Subsurface drainage, Chlorides, Irrigation, Drainage, Land reclamation, Salinity, Salts, Sulfates, Sodium compounds.
Identifiers: *USSR, Solonchak, Solonetz.

The meliorative effect of a direct electrical current on alkaline and saline soils by increasing the efficiency of leaching has been described. The electric current accelerates leaching of salts from the soil due to a directed movement of the ions (electrolysis) and the soil solution (electro-osmosis) to the cathode, the drain. Rate of salt removal at a current of 1 mA/sq cm is twice as low compared to desalinization at a current of 2 mA/ sq cm. The electric current, depending on its density, reduces 15 times the time of solonetz-solonchaks leaching; in the case of permeable soils such as solonchak the efficiency of the current is considerably lower. On the other hand, efficiency of the water used at lower current density is higher owing to slower movement of water and its prolonged action on the soil. Simultaneously with desalinization, desolonetzization also takes place which in the course of usual leachings results in much larger water and time requirements especially in soda-salinized solonetzic soils. In the case of leaching of solonchaks with water combined with electric current no solonetzization takes place, usually observed when leaching with water alone. The current influence substantially improves the physical properties of soils; the content of fine particles is reduced, and that of water stable micro- and macro-aggregates increased and the water conductivity of soil also increased thus facilitating leaching of impermeable soils. Meliorative effect of the current is almost proportional to the quantity of the electricity passed through the soil.

WATER REPELLENT SANDS,
Commonwealth Scientific and Industrial Research Organization, Adelaide (Australia). Div. of Soils.
R. D. Bond.
Trans of 9th Int Congr of Soil Sci, Adelaide, Australia, Vol 1 of 4 vol, pp 339-347, 1968. 9 p, 4 fig, 11 ref.

Descriptors: *Impervious soils, *Sands, *Organic matter, Oil, Humus, Humic acids, Infiltration, Crop production, Crop response, Infiltrometers.
Identifiers: *Australia, *Impervious sands.

Many sandy soils in Australia are not wetted readily by water. Rainwater penetrates into such soils through narrow columns leaving the intervening soil quite dry. Where the intensity of repellence is high, these dry patches, devoid of plant growth, may persist through the wet winter period. The water repellence is caused by organic coatings which prevent the water films from spreading over the sand as the advancing contact angle of wetting with water is frequently greater than 90 deg. The effect of these water repellent coatings on penetration of water into soil is discussed and shown to be the factor limiting infiltration rates into repellent sands. Field observations and tests have shown that the degree of repellence varies with the type of plant cover and age of pasture.

THE ANISOTROPIC NATURE OF LIQUID FLOW IN CLAY-WATER SYSTEMS,
Commonwealth Scientific and Industrial Research Organization, Griffith (Australia). Div. of Soils.
A. V. Blackmore.
Trans of 9th Int Congr of Soil Sci, Adelaide, Australia, Vol 1 of 4 vol, pp 223-231, 1968. 9 p, 4 fig, 11 ref.

Descriptors: *Soil water movement, *Clays, *Anisotropy, Bentonite, Kaolinite, Electrical conductance, Hydraulic conductivity.
Identifiers: Formation factor.

Methods are described for obtaining permeability and electrical conductance of clay pastes as a function of their particle orientation relative to the direction of the potential gradient. Measurements are made with montmorillonite and kaolin clays over a wide range of porosity (interparticle spacing) and the effect of free electrolyte is studied. The results show that these transport properties are extremely sensitive to the internal arrangement of the pastes, both properties being several times larger when the material is aligned parallel to the flow direction than in the orthogonal situation. It appears that tortuosity is the dominant factor in this difference. Conductance data, in association with the simple geometry in the case of orientation parallel to the gradient, may be used to estimate hydrodynamic tortuosity in some circumstances.

DYNAMIC MEASUREMENT OF THE HYDROLOGIC CHARACTERISTICS OF UNSATURATED POROUS MATERIALS,
New South Wales Univ., Kensington (Australia). School of Civil Engineering.
K. K. Watson.
Trans of 9th Int Congr of Soil Sci, Adelaide, Australia, Vol 1 of 4 vol, pp 283-290, 1968. 8 p, 2 fig, 19 ref.

Descriptors: *Soil water movement, *Hydraulic conductivity, *Infiltration, *Soil moisture meters, *Soil physical properties, Nuclear moisture meters, Piezometers, Instrumentation, Permeameters Tensiometers, Drainage, Permeability, Unsaturated flow, Hydraulic conductivity, Porosity.
Identifiers: Gamma-attenuation moisture meters.

The increasingly important role of a dynamic approach to the measurement of the hydrologic characteristics of porous materials is discussed and the specification for such measurement outlined. This specification is met satisfactorily by the well known gamma attenuation method for water content measurement and by a tensiometer-pressure transducer assembly for pressure head measurement. Correction procedures for response errors for each system are detailed together with studies on the sensitivity of the tensiometer-pressure transducer assembly. These studies concern the effect on the pressure output of temperature variations and the response behaviour of the unit under conditions of changing pore air pressure. The application of dynamic measurement to the determination

of the hydraulic conductivity-water content relationship is outlined and a system-dependent effect in the pressure head-water content relationship as measured in a stratified column (fine over coarse sequence) is described.

THE EFFECT OF FLUCTUATIONS IN FLUID VELOCITY ON HYDRODYNAMIC DISPERSION,
Commonwealth Scientific and Industrial Research Organization, Adelaide (Australia). Div. of Soils; and Agricultural Research Service, Ames, Iowa. Soil and Water Conservation Research Div.
D. A. Farrell, and W. E. Larson.
Trans of 9th Int Congr of Soil Sci, Adelaide, Australia, Vol 1 of 4 vol, pp 173-184, 1968. 12 p, 2 fig, 14 ref.

Descriptors: *Dispersion, *Diffusion, *Capillary action, *Soil water movement, Porous media, Heterogeneity, Mass transfer, Suspension.
Identifiers: *Hydrodynamic dispersion, Capillary flow.

The effect of fluctuations in fluid velocity on dispersal in a straight capillary tube is analyzed mathematically. For sinusoidal oscillations in fluid velocity the partial differential equation describing the changing distribution of the dispersing materials is solved by using the method of separation of variables. The use of this mathematical technique reduces the problem to finding the solution of two simultaneous ordinary differential equations. The analysis is then extended to cover changes in the waveform of the oscillations by using the method of superposition. For periodic oscillations in the velocity of the convecting fluid, the effective diffusion coefficient is shown to depend not only on the diffusion Peclet number but also on the waveform and generalized frequency of the oscillations. For random fluctuations that can be characterized by an exponentially decaying autocorrelation coefficient the effective diffusion coefficient is shown to depend on the diffusion Peclet number and the generalized time scale of the velocity function.

THE REMOVAL OF DISSOLVED PHOSPHATE FROM LAKE WATERS BY BOTTOM DEPOSITS,
A. V. Holden.
Verh Internat Verein Limnol, Vol 14, pp 247-251, July 1961. 4 fig, 2 ref.

Descriptors: *Phosphate, *Lakes, *Cycling nutrients, *Sediment-water inferface, Mud-water interface, Phosphorus, Adsorption, Eutrophication, Algae, Macroaquatic plants, Fertilization.

Phosphate fertilizer was added to Scottish lochs and phosphate loss from the water measured. At low levels of phosphate added (45 micrograms/liter) the expotential expression dc/dt= Kc described phosphate decline; at higher levels, the expression was altered to account for phosphate saturation of the sediment. Removal rates were expressed as KD values, micrograms phosphate/centimeter squared, per milligrams phosphate/liter per day. A KD value of 6.5 for Loch Kinardochy as compared with 0.6 for cores overlain by water (30 to 40 cm) and lacking algae or macrophytes, suggested that attached flora largely accounted for phosphate uptake in the loch. In laboratory experiments involving high phosphate uptake (700 micrograms/cm squared), phosphate increase up to 200 milligram phosphate percent occurred in the sediment aerobic zone (upper 20 millimeters); some phosphate penetrated to 80 millimeters, into anaerobic zone. About 6% of phosphate retained in the aerobic zone was decinormal hydrochloric acid extractable. Development of anerobic zones decreased acid-extractable phosphorus, although author does not state whether reoxidation occurred before extraction. Phosphorus gradients from productive, unfertilized lochs, were similar to fertilized lochs incubated 48 months. (Armstrong-Wis)

FRACTIONATION OF PHOSPHORUS IN LAKE SEDIMENTS: ANALYTICAL EVALUATION,
Connecticut Agricultural Experiment Station, New Haven.
C. R. Frink.
Soil Sci Soc Amer Proc, Vol 33, No 2, pp 326-328, Mar-Apr 1969. 3 p, 9 ref.

Descriptors: *Water chemistry, *Lakes, *Phosphorus compounds, *Analytical techniques, *Evaluation, Oxidation, Colorimetry, Inorganic compounds, Organic compounds, Nutrients, Water analysis.
Identifiers: Phosphorus fractionation.

Methods for the fractionation of P in soils were evaluated in the fractionation of P in lake sediments. Both Al-P and Fe-P may be determined readily and precisely by the Chang and Jackson procedure. Reductant-soluble P was more difficult: modifications of a citrate oxidation procedure utilizing potassium permanganate produced an acceptable method. Large amounts of Fe in the Ca-P extracts caused low results, but this was overcome by limiting the aliquot size. Organic P determined by difference between total and inorganic P was not related to the organic matter content of the sediments. An alternative measure of inorganic P, obtained by summing the inorganic P fractions, yielded values for organic P which were correlated with organic matter.

THE IMPORTANCE OF MASS FLOW IN THE UPTAKE OF IONS BY ROOTS FROM SOIL,
Oxford Univ. (England). Dept. of Biomathematics; and Oxford Univ. (England). Dept. of Agriculture.
F. H. C. Marriott, and P. H. Nye.
Trans of 9th Int Congr of Soil Sci, Adelaide, Australia, Vol 1 of 4 vol, pp 127-134, 1968. 8 p, 2 fig, 2 tab, 11 ref.

Descriptors: *Soil-water-plant relationships, *Soil water movement, *Nutrients, Mass transfer, Solutes, Diffusion, Dispersion, Root systems, Ion transport.
Identifiers: Nutrient transport, Root growth.

Assessment of the relative contribution of mass flow and diffusion to uptake is a matter of definition, and it is less arbitrary to consider the increase in uptake caused by increase in rate of transpiration. The concentration at the root surface and the flux are estimated in terms of the transpiration rate, diffusion coefficient, root absorbing power, root radius and time, by solving a 2nd order partial differential equation numerically. An approximate simple algebraic expression due to Passiours is correct within 10% if transpiration is larger than root absorbing power, which usually holds. When it is smaller, flux increases linearly with transpiration. With increase in transpiration, the proportionate increase in flux due to mass flow, over the flux when transpiration is zero, is independent of root absorbing power. It increases markedly with decrease in moisture level, because the flux when transpiration is zero is then low. It is not greatly affected by the ion species.

CONSUMPTION OF WATER BY PLANTS DEPENDING ON THE NEGATIVE PRESSURE OF THE SOIL WATER,
Akademiya Nauk SSSR. Laboratoriya Lesovedeniya.
N. A. Vznuzdaev.
Trans of 9th Int Congr of Soil Sci, Adelaide, Australia, Vol 1 of 4 vol, pp 109-116, 1968. 8 p, 3 fig, 8 ref.

Descriptors: *Soil-water-plant relationships, *Drying, *Transpiration, *Negative pressure, Wilting, Field capacity, Moisture content, Moisture stress, Soil moisture, Soil moisture movement, Arid lands, Pine trees, Oak trees, Consumptive use.
Identifiers: Negative soil water pressure.

Pot experiments with saplings of pine, oak and elm showed that transpiration rate in the interval of soil water pressure from -0.3 to -2.5 atmospheres (zero pressure gradient) was determined by air temperature and humidity. At a soil water pressure less than -2.5 atmospheres, transpiration decreased sharply and became inversely proportioned to soil water pressure, irrespective of environment. The suction forces of roots and leaves are directly related. Neither moisture characteristics of the two soils used nor the species of the trees appeared to have any appreciable affect on this relationship. Plants died when pressure was less than -44 atmospheres. Water deficiency was clearly revealed in changes in the morphology and anatomy of roots, physiologically active in absorption of water.

COASTAL DUNE STRUCTURES FROM PARANA (BRAZIL),
Parana Univ., Curitiba (Brazil). Geological Inst.
Joao Jose Bigarella, Rosemarie D. Becker, and Gerusa M. Duarte.
Marine Geol, Vol 7, No 1, pp 5-55, Feb 1969. 51 p, 32 fig, 4 tab, 25 ref.

Descriptors: *Dunes, *Coasts, *Sedimentary structures, Sedimentation, Winds, Movement, Provenance, Beds, Stratification, Sands.
Identifiers: *Brazil, Cross-bedding.

In the coastal plain of Parana, vertical sections, both parallel to and transverse to the average wind direction, were dug and cut through dunes. These were compared with the ones presented by the older sand ridge dunes from the Parana coastal plain. The structures of the sand ridge dunes were compared also with those from other types of dunes described by McKee (1966) from the White Sands National Monument (New Mexico) and from the Libyan Desert. The analysis of cross-bedding indicates many common features between the dunes studied by McKee and those from the Parana coastal plain, including high-angle foresets, 30 deg to 36 deg, the almost horizontal character of many bounding surfaces, thinner and flatter individual sets of cross-stratification near the tops of vertical sections, dominant tabular planar sets, and many sets of simple and trough type of cross-stratification. Especially characteristic of the coastal dunes are the convex-upward foresets, located in the upper part of the dune's brink where high-angle slipface strata occur. They result mostly from slumping. The cross-strata dip resultant vector for the whole dune coincides with the average wind direction. (Knapp-USGS)
W69-06965

NORTHWESTERN AFRICAN CONTINENTAL SHELF SEDIMENTS,
Rhode Island Univ., Kingston. Graduate School of Oceanography.
Robert L. McMaster, and Thomas P. Lachance.
Studies supported by contract with Office of Naval Research. Nonr 396 (08) ONR. Marine Geol, Vol 7, No 1, pp 57-67, Feb 1969. 11 p, 5 fig, 11 ref.

Descriptors: *Sedimentation, *Stratigraphy, *Coastal plains, Continental shelf, Sands, Silts, Clays, Erosion, Provenance, Marine Geology, Sediment transport, Stratification, Carbonates.
Identifiers: *Africa, Sedimentary facies.

An investigation of the gravel, sand, silt, and clay components and carbonate content of the bottom surface sediments on the northwestern African shelf and upper slope reveals that sand, composed of biogenic material, quartz, and glauconite, is the most common sediment type. This sand is primarily of biogenic origin between Ifni and Cape Blanc (21 deg N) and immediately south of Cape Verde (15 deg N) whereas the wide Guinea shelf is covered with low carbonate quartz sand. Glauconite is common on the outer shelf and upper slope. Modern mid-shelf slit facies occur immediately south of the Strait of Gibraltar, on the south side of Cape Ghir (30 deg N), between the Gambia and Geba Rivers, and along the narrow Sierra Leone-Liberian shelf. Generally, illite, kaolinite, and montmorillonite are present in these facies with kaolinite predominant in the tropical areas. Modern mid-shelf facies are found where the shelf is narrow and the sediment supply is ample. Apparently bottom turbulence and current action are not sufficient to keep the outer shelf free of fine sediment accumulation. Where the shelf is wide, modern fine sediments are being deposited in estuaries and on the inner shelf. Also, a calcareous sediment type is found where the shelf has been tectonically stable and the sediment supply inadequate. Finally, carbonate values, less than 50%, OCCUR WHERE A MODERN SHELF FACIES IS BEING DEPOSITED OR WHERE CLASTIC SEDIMENTS WERE DISTRIBUTED DURING Pleistocene low sea levels.

OFFSHORE SEDIMENTS AND VALLEYS OF THE ORANGE RIVER (SOUTH AND SOUTHWEST AFRICA),
Georgia Univ., Sapelo Island. Marine Inst.; Georgia Univ., Athens. Dept. of Geology; Millersville State Coll., Pa.; and Ocean Science and Engineering, Inc., Washington, D. C.
John H. Hoyt, B. L. Oostdam, and David D. Smith.
Marine Geol, Vol 7, No 1, pp 69-84, Feb 1969. 16 p, 9 fig, 1 tab, 20 ref.

Descriptors: *Sedimentation, *Rivers, *Channels, *Deposition (Sediments), Deltas, Erosion, Marine Geology, Sediment yield, Silting, Streams, Clays, Coastal plains, Coasts, Currents (Water), Waves (Water).
Identifiers: *South Africa, Submarine valleys.

Detailed 'sparker' surveys of the inner continental shelf off the Orange River, the major drainage of southern Africa, defined a large sediment lens and 2 buried offshore extensions of the bedrock valley. Intermixed river and shelf sediments form a body that is air-foil shaped in plan with trailing edge down-current (northwest). This body extends seaward 16 mi and laterally about 70 mi, has a maximum thickness 6 mi offshore of more than 200 ft, and a volume of approximately 9 cu mi. The sediment surface slopes 10 ft/mi out to 100 ft depths and then steepens to 30-40 ft/mi to 400 ft below sea level. Most sediments appear to be fine sands, silts and clays of probable Late Pleistocene-Holocene age. At the coastline, 2 submarine valley floors are about 150 and 200 ft below sea level and are cut as much as 150 ft into the bedrock platform. Since the slope of the valley floors (20 ft/mi) is not as steep as that of the bedrock platform (50 ft/mi) the valleys intersect the platform surface at depths of about 250 and 300 ft, suggesting 2 or more emergences to approximately those levels. Absence of a subaerial delta results from intensive wave attack by the obliquely impinging South Atlantic swells, which cause a highly effective longshore sediment transport system.

X-RAY ANALYSES OF CLAY MINERALS IN SOME RECENT FLUVIATILE SEDIMENTS ALONG THE COASTS OF CENTRAL ITALY,
Amsterdam Univ., (Netherlands).
J. Quakernaat.
Amsterdam Univ Physico-Geogr Lab Publication No 12, 1968. 105 p, 67 fig, 10 tab, 90 ref, 4 append.

Descriptors: *Clay minerals, *Sedimentary petrology, *X-Ray spectroscopy, *Sedimentation, Sampling, Potassium, Calcium, Magnesium, Chemical analysis, Cation exchange, Water analysis, River flow, Estuaries.
Identifiers: *Central Italy, *Fluviatile sediments.

Distribution of clay minerals in recent fluviatile sediments in the estuaries of several Italian rivers was investigated by using 73 samples from 52 rivers and utilizing a Guinier-de Wolff X-ray camera and an X-ray diffractometer. The qualitative and quantitative results of the study show that 4 clay mineral provinces can be identified along the coasts of central Italy characterized as follows: (1) rivers carrying 60 to 70% of illite and irregular illite-chlorite interstratification; (2) rivers carrying 20 to 50% of illite and irregular smectite-chlorite interstratification; (3) rivers transporting 20 to 40% of high-charge smectite and small amount of kandite; and (4) the river sediments containing high-charge vermiculate and smectite (30 to 40%), 20 to 40% of illite, and 10% of kandite. MODEL STUDY OF HYDRAULIC PHENOMENA ASSOCIATED WITH RIVER BED EROSION AROUND A BRIDGE PIER (POLISH),
Warsaw Engineering Coll., (Poland).
Andrzej Szuster.
Arch Hydrotech, Vol 15, No 4, Warsaw, pp 571-586, 1968. 16 p, 10 fig, 5 ref.

LIBRARY U. OF I., URBANA-CHAMPAIGN

Descriptors: *Model studies, *River bed, *Erosion, *Piers, Bridge design, Hydraulic models, Runoff, Streamflow, Currents (Water), Floods, River basin development, Velocity, Water level fluctuations, Mathematical studies.
Identifiers: *Poland, River bed erosion.

Hydraulic phenomena taking place around bridge piers were investigated analytically and experimentally by using piers of various forms and dimensions. Experiments were particularly concerned with the identification of water streamflow patterns around the models, the distribution of stream vertical velocities, and water level fluctuations around the pier models. The study shows that a diamond-shaped pier is associated with the minimum amount of river bed erosion. (Gabriel-USGS)

THE TIDAL ORIGIN OF SOME VERTICAL SEDIMENTARY CHANGES IN EPICONTINENTAL SEAS,
National Inst. of Oceanography, Wormley (England).
M. A. Johnson, and R. H. Belderson.
J. Geol, Vol 77, No 3, pp 353-357, May 1969. 5 p, 8 ref.

Descriptors: *Sedimentation, *Stratification, *Tides, *Currents (Water), Erosion, Deposition (Sediments), Channels, Deltas, Sedimentary structures, Sediment transport, Bed load, Bottom sediments, Tidal effects, Sea level.
Identifiers: Tidal Currents, Sea level changes.

Vertical changes in grain size and sedimantary structure of shallow sediment deposits and sedimentary rocks are a function of tidal-current action as well as water depth and distance from shore. Tidal current strength depends upon the tidal regime of the whole sea and upon many local factors, some of which may change more rapidly than water depth. Tidal current changes will also occur with any depth changes, and the sedimentary record will preserve the results of both. It is not safe to ascribe sedimentary changes to depth changes alone. Examples of major changes in tidal current patterns with insignificant depth changes include the opening of Dover straits and the opening of the Irish Sea. Smaller tidal current changes may be caused by rapid delta formation, shoreline retreat, sedimentation in tidal channels, and the effect of engineering structures such as dams and Jetties. Dokl Akad Nauk USSR, Vol 185, No 3, pp 679-682, 1969. 4 p, 2 fig, 1 tab, 17 ref.

Descriptors: *Tracers, *Metals, *Marine geology, Sediments, Precipitable water, Mud, Carbonates, Organic matter, Geochemistry, Erosion, Sands, Clays, Limestones, Sulfides, Abrasion.
Identifiers: Black Sea germanium-bearing sediments.

Distribution and content of germanium in the recent sediments of the Black Sea was investigated by using a standard colorimetric method. The study shows that germanium is characterized by a relatively poor geochemical mobility during the sedimentation process; however its mobile forms are transported into the Black Sea in a soluble state. The distribution of germanium in the recent sediments of the Black Sea shows that the highest Ge concentrations are observed in the marginal parts of the basin, as a result of considerable amount of clastic material due to the abrasion of coastal rocks. WHERE MOST GRAINS OF VERY COARSE SAND AND FINE GRAVEL ARE DEPOSITED,
Louisiana State Univ., Baton Rouge. Coastal Studies Inst.
Richard J. Russell.
Sedimentology, Vol 11, No 1-2, pp 31-38, Oct 1968. 8 p, 1 fig, 2 tab, 19 ref. Contract Nos Nonr 35 608, 388 002 and Nonr 1575 (03), 388 002.

Descriptors: *Sedimentation, *Sediments, *Particle size, Erosion, Sediment transport, Flow, Sediment yield, Sedimentology, Sediment discharge.
Identifiers: Particle entrainment.

Although supplied to rivers, grains of about 1-6 mm diameters are notably deficient in fluvial deposits because they are more readily entrained and more rapidly transported than grains of larger or smaller size. Very coarse sand and fine gravel are rarely found in shallow-water sediments for the same reason. Currents, mainly of wave origin, concentrate these grains in beaches, where they are present in more-than-ordinary abundance.

SUSPENDED LOAD IN THE RIO DE LA PLATA DRAINAGE BASIN,
Instituto Nacional de Limnologia, Santo Tome (Argentina); and Scripps Institution of Oceanography, La Jolla, Calif.
P. J. Depetris, and J. J. Griffin.
Sedimentology, Vol 11, No 1-2, pp 53-60, Oct 1968. 8 p, 2 fig, 4 tab, 9 ref.

Descriptors: *Sedimentology, *Provenance, *Erosion, Streamflow, Clays, Silts, Sediment yield, Sediment transport, Mineralogy.
Identifiers: Rio de la Plata (Argentina).

The Rio de la Plata Drainage Basin is the second largest in South America, with more than 75% of its discharge provided by the Parana River and the remainder by the Uruguay River. Erosion rates, and silt- and clay-size mineralogy indicate that most of the basin loads are provided by the mountainous environment-type.

EXPERIMENTAL INVESTIGATION ON THE EROSION-SENSITIVITY OF A SAND-CLAY LAMINATION,
Ministry of Transport and Waterways, The Hague (Netherlands); and Waterloopkundig Laboratorium, Delft (Netherlands).
J. H. J. Terwindt, H. N. C. Breusers, and J. N. Svasek.
Sedimentology, Vol 11, No 1-2, pp 105-114, Oct 1968. 10 p, 5 fig, 3 tab, 15 ref.

Descriptors: *Erosion, *Estuaries, *Sediments, Sands, Silts, Turbulence, Channel erosion, Sedimentology, Shear stress, Resistance, Model studies, Hydraulic models.
Identifiers: Laminated sediments.

Laboratory tests were made of the critical shear stress and bed erosion as a function of time and bed shear stress for a sediment consisting of alternating sand and clay layers 0.1-3 cm thick. This type of deposit occurs quite frequently in estuaries and tidal inlets. The tests were carried out on an original bed deposited in an estuary. The critical shear stress and the degree of erosion in relation to time for the sand-clay lamination were found to agree in order of magnitude with those for clay layers. The resistance to erosion of the sand-clay lamination is therefore comparable with that of clay layers.

SOME EXPERIMENTS ON THE GENESIS OF TURBIDITY CURRENTS,
Koninklijke-Shell Exploratie en Produktie Laboratorium, Rijswijk (The Netherlands).
W. Van der Knaap, and R. Eijpe.
Sedimentology, Vol 11, No 1-2, pp 115-124, Oct 1968. 10 p, 4 fig, 1 tab, 8 ref.

Descriptors: *Model studies, *Turbidity currents, *Sediment transport, Density currents, Provenance, Slopes, Sands, Silts, Clays, Mixing, Stratification, Pore pressure, Hydraulic models, Porosity, Permeability.
Identifiers: Flume studies.

Turbidity currents are thought to be the agency responsible for the transport and deposition of the sediments known as turbidites. The way in which such currents may arise has been studied experimentally in a glass-walled tank. The starting point of the experiments was setting the sediments in motion by raising their pore pressure via a shock or vibration. This was achieved in the experiments by striking the metal bottom of the tank with a mallet. The response of a heap of homogeneous sand to such a shock was merely to change the angle of its slope. If a layer of sand was draped over a core of coarser, homogeneous sand, sliding occurred along the plane of permeability contrast and the less coarse sand was deposited at the toe of the slope. When the layer consisted of kaolin, which has a much lower permeability than sand, sliding again took place, butthe clay subsequently mixed with the water and was moved along the bottom of the tank in the manner attributed to turbidity currents. An attempt is made to set up a scaling rule for experiments of this type and the consequences that such a rule may have in subsequent study are briefly discussed.

NUTRIENT REGENERATION AND PREFORMED NUTRIENTS OFF OREGON,
Kilho Park.
Limnology and Oceanography, Vol 12, No 2, pp 353-357, April 1967. 3 fig, 10 ref.

Descriptors: *Cycling nutrients, *Nutrients, *Oregon, Nitrates, Phosphates, Silicates, Oceanography.
Identifiers: *Chemical oceanography, Preformed nutrients, Nutrient ratios.

Vertical distribution of nitrate, phosphate and silicate off the Oregon coast is presented. Measured nitrate and phosphate are divided into two fractions: (1) nutrients of oxidative origins that have

been regenerated from organic matter, and (2) preformed nutrients that were present as such in the water at the time it sank from the surface. The ratios in the biochemical changes in oxygen:nitrogen:phosphorus are 138:16:1, and phosphorus are 7:1. This preformed nutrient ratio might be used to trace the water to its origin. The report also describes vertical nutrient regeneration off the Oregon coast. (Konrad-Wis)

GEOCHEMISTRY OF SUBSURFACE BRINES.
Kansas Univ., Lawrence. Dept. of Civil Engineering; Kansas State Geological Survey, Lawrence; and Louisiana State Univ., Baton Rouge. School of Geology.

E. E. Angino, and G. K. Billings (Editors). Proc of Symp on Geochem of subsurface brines, Kansas Univ, Mar 25-26, 1968. Chem Geol, Vol 4, No 1-2, Mar 1969. 371 p.

Descriptors: *Geochemistry, *Brines, *Subsurface investigations, *Subsurface flow, Groundwater movement, Water chemistry, Solutes.
Identifiers: Subsurface brines.

A symposium dealing with the subject of geochemistry of subsurface brines was held at the University of Kansas on Mar 25-26, 1968 and was sponsored by State Geological Survey of Kansas, Kansas University, and the Geochemical Society of America. The symposium served 3 purposes; it gives evidence that the chemistry of subsurface brines is still in what could be called 'state of art stage,' collects under one cover for the first time a summary of the many problems facing those working with subsurface brines, and presents a good summary of our knowledge of the chemistry of subsurface brines and the problems relative thereto. SUBSURFACE BRINES AND MINERAL EQUILIBRIA,
McMaster Univ., Hamilton (Ontario). Dept. of Geology.
James R. Kramer.
Chem Geol, Vol 4, no 1-2, pp 37-50, Mar 1969. 14 p, 8 fig, 6 tab, 15 ref. Proc of Symp on Geochem of Subsurface Brines, Kansas Univ, Mar 25-26, 1968.

Descriptors: *Water chemistry, *Groundwater, *Brines, *Saline water, *Chemical properties, Equilibrium, Data processing, Digital computers, Statistical methods, Regression analysis, Aquifers, Geochemistry, Aqueous solutions.
Identifiers: *Factor analysis.

About, 2,500 brine chemical analyses were classified according to lithology of their source aquifers. Factor analysis was used to determine possible mineral equilibria. Conclusions from factor analysis are used to calculate ion products which are compared with thermodynamically derived equilibrium values. In most analyses, Cl, sulfate, Na, Ca, Mg, bicarbonate, Sr, and Ba are reported. Most waters are Na -Ca-chloride types saturated in calcium carbonate. Sulfate is an independent variable in most waters but has a weak inverse relationship to bicarbonate, a positive correlation to Mg, and sometimes is weakly inverse to Sr and Ba, suggesting an Sr-Ba-sulfate equilibrium. Ca and Mg show a stronger inverse correlation to bicarbonate in dolomite than in other rocks. Ca shows a stronger correlation with Mg in dolomite than in limestone, suggesting Ba-Sr-carbonate equilibrium. Equilibrium involving K-Mg-H-Si is suggested by data from a smaller population of more complete analyses. For main entry see W69-06950. (Knapp-USGS)

ION ASSOCIATION IN NATURAL BRINES,
Geological Survey, Menlo Park, Calif., and Geological Survey, Washington, D. C.
Alfred H. Truesdell, and Blair F. Jones.
Chem Geol, Vol 4, No 1-2, pp 51-62, Mar 1969. 12 p, 1 fig, 4 tab, 26 ref. Proc of Symp on Geochem of Subsurface Brines, Kansas Univ, Mar 25-26, 1968.

Descriptors: *Water chemistry, *Ions, *Brines, *Saline water, *Equilibrium, Chemical potential, Chemical reactions, Thermodynamics, Electrical conductance, Aqueous solutions.
Identifiers: *Activity coefficients.

Natural brines, both surface and subsurfaces, are highly associated aqueous solutions. Ion complexes in brines may be ion pairs in which the cation remains fully hydrated and the bond between the ions is essentially electrostatic, or coordination complexes in which one or more of the hydration water molecules are replaced by covalent bonds to the anion. Except f . Cl, the major simple ions in natural brines form ion pairs; trace and minor metals in brines form mainly coordination complexes. Limitations of the Debye-Huckel relations and lack of data on definition and stability of all associated species in concentrated solutions tend to produce underestimates of the degree of ion association, except where the brines contain a very high proportion of Cl. Data and calculations on closed basin brines of highly varied composition and electrode measurements of single-ion activities emphasize the role of magnesium complexes. Alkaline sulfo- or chloro-carbonate brines (western Great Basin) carry significant trace metal contents apparently as hydroxides or hydroxy polyions. Neutral high chloride brines (Bonneville Basin) are generally deficient in trace metals. Many brine-mineral equilibria, particularly for high-density brines, may be studied thermodynamically. GEOCHEMISTRY OF PORE WATERS FROM SHELL OIL COMPANY DRILL HOLES ON THE CONTINENTAL SLOPE OF THE NORTHERN GULF OF MEXICO,
Geological Survey, Woods Hole, Mass.; and Woods Hole Oceanographic Institution, Mass.
F. T. Manheim, and J. L. Bischoff.
Chem Geol, Vol 4, No 1-2, pp 63-82, Mar 1969. 20 p, 9 fig, 5 tab, 26 ref. Proc of Symp on Geochem of Subsurface Brines, Kansas Univ, Mar 25-26, 1968.

Descriptors: *Water chemistry, *Groundwater, *Drill holes, *Brines, Salts, Chemical reactions, Equilibrium, Aqueous solutions, Ion transport, Diffusion, Chemical precipitation, Geochemistry, Continental slope, Salinity.
Identifiers: *Pore waters, Salt domes.

Pore waters were analyzed from 6 holes drilled in water depths of 600-3,000 ft, penetrating up to 1,000 ft of Pliocene-Recent clayey sediments. Salt and anhydrite caprock were encountered in one diapiric structure on the continental slope. Samples from holes drilled near diapiric structures showed systematic increases of pore-water salinity with depth, suggestive of salt diffusion from underlying salt plugs. Anomalous concentrations of K and Br indicate that at least 1 plug contains late-stage evaporate minerals. Salinities approaching halite saturation were observed. Samples from holes away from diapiric structures showed little change in pore-water chemistry, except for loss of sulfate and other variations attributable to early-stage diagenetic reactions with enclosing sediments. Thus, increased salt concentrations in even shallow sediments from this part of the Gulf appear to provide an indicator of salt masses at depth. For main entry see W69-06950. (USGS)

ON THE EVOLUTION OF SUBSURFACE BRINES IN ISRAEL,
Hebrew Univ., Jerusalem (Israel). Dept. of Geology.
Y. K. Bentor.
Chem Geol, Vol 4, No 1-2, pp 83-110, Mar 1969. 28 p, 20 fig, 2 tab, 14 ref, 1 append. Proc of Symp on Geochem of Subsurface Brines, Kansas Univ, Mar 25-26, 1968.

Descriptors: *Water chemistry, *Groundwater, *Brines, Classification, Evaporation, Equilibrium, Geochemistry, Salts, Saline water, Aqueous solutions.
Identifiers: *Israel, Dead Sea Rift Valley.

Subsurface brines occur in Israel at depths of 1,000-3,400 m in Early Cambrian-Early Cretaceous formations. Some are identical in composition and salinity with present-day ocean water, except for higher Ca and lower Mg content, a change attributed to dolomitization. The oilfield waters in Early Cretaceous formations of the coastal plain are still similar to ocean water, but 2 to 3 times more saline; they have lost most of their sulphates and are enriched in Br and I, both derived from organic sources. In brines from Jurassic to Early Cambrian sources, salinities as well as the Ca/Na and Br/I ratios increase progressively with depth while the Na/K, bicarbonate/Cl and Cl/Br ratios decrease. It is assumed that the lowermost Paleozoic brines formed by surface evaporation during Infracambrian to Early Cambrian time and were later modified by differential ultrafilitration. Highly saline brines at the depth in the Rift Valley are chemically similar to the Early Paleozoic brines, but even more differentiated. Some show salinities of around 300,000 ppm, a Na/K-value of 1-2 and extremely high Ca concentrations. These waters are believed to be old Paleozoic brines that have undergone a new cycle of surface concentration in Pleistocene Rift Valley lakes, the precursors of the Dead Sea. WATER HISTORY OF CRETACEOUS AQUIFERS, EAST TEXAS BASIN,
Albion Coll., Mich.
John W. Parker.
Chem Geol, Vol 4, No 1-2, pp 111-133, Mar 1969. 23 p, 22 fig, 16 ref. Proc of Symp on Geochem of Subsurface Brines, Kansas Univ, Mar 25-26, 1968.

Descriptors: *Water chemistry, *Groundwater, *Brines, *Saline water, *Texas, *Aquifers, Geochemistry, Thermal water, Aqueous solutions, Saline water intrusion, Saline water systems, Solutes, Ions, Chemical reactions, Connate water, Groundwater basins.
Identifiers: *East Texas Basin, Cretaceous aquifers.

Circumstantial evidence of the history of water in 5 Cretaceous aquifers is supplied by water analyses comparisons and a study of the ratios of the major ions, Ca, Mg, Na, Cl, sulfate and bicarbonate. Water from each aquifer has distinctive characteristics, but there are interconnections, especially near the Mexia-Talco fault zone and at an unconformity that extends across the Sabine uplift. Some piercement salt domes modify formation waters, but most salt domes have little or no noticeable effect. Apparently clay sheaths protect the salt columns from solution. Town water supplies on the north Texas shelf are affected by invasion of hot brine from the Tyler Basin, moving from east to west through the Woodbine Sandstone. Ion ratio comparisons show that waters in the older, more deeply buried aquifers have been modified more (compared with present-day sea water) than that in younger, less deeply buried aquifers. Ion ratio maps show the effect of time and rock compositions upon the relative kind and amount of dissolved solids in the water, due to reactions with minerals and organic material in the rocks. LIBRARY U. OF I., URBANA CHAMPAIGN

GEOCHEMISTRY OF SALINE SUBSURFACE WATER, SALINE COUNTY (MISSOURI),
Missouri Univ., Columbia, Dept. of Geology.
Alden B. Carpenter, and John C. Miller.
Proc of Symp on Geochem of Subsurface Brines, Kansas Univ, Mar 25-26, 1968. OWRR Proj No B-002-MO. Chem Geol, Vol 4, No 1-2, pp 135-167, Mar 1969. 33 p, 22 fig, 11 tab, 32 ref.

Descriptors: *Water chemistry, *Groundwater, *Brines, *Saline water, *Missouri, Equilibrium, Statistical methods, Aqueous solutions, Saline water systems, Aquifers, Limestones, Dolomites, Geochemistry, Connate water, Solutes, Ions, Clays, Ion Exchange.
Identifiers: *Saline County (Missouri).

Saline subsurface water quality in central Missouri is largely governed by mineralogy. Although the water is supersaturated with respect to quartz, the silica concentration is held constant, apparently by the dissolution of illite. A series of scatter diagrams for the water indicates that potassium and hydrogen ion have a markedly different relationship to variations in salinity than do other group Ia elements. The K /H activity ratio is apparently controlled by the presence of illite or illite plus kaolinite. Calculation of ion activity products indicates that the saline water is approximately saturated with respect to calcite and dolomite. The mean Ca /Mg activity ratio, 1.51, is reasonable for water from dolomite limestones. The variations in the Ca/Na and Mg/Na ratios in the Missouri water samples can be predicted using a model in which the concentration of Na is affected only by the addition or removal of water from the system whereas the concentrations of Ca and Mg are additionally affected by equilibration with calcite and dolomite. The ion activity products for Sr and Ba carbonates suggest saturation and that the Sr/Ba activity ratio is mineralogically controlled. Because the chemistry of the saline water is now controlled to a large extent by its mineralogical environment the compositional characteristics of the water cannot be used to determine the origin of the salinity. (For main entry see W69-06950.)
W69-06957

CHEMISTRY OF SOME ANADARKO BASIN BRINES CONTAINING HIGH CONCENTRATION OF IODIDE,
Bureau of Mines, Bartlesville. Okla. Bartlesville Petroleum Research Center.
A. Gene Collins.
Proc of Symp on Geochem of Subsurface Brines, Kansas Univ, Mar 25-26, 1968. Chem Geol, Vol 4, No 1-2, pp 169-187, Mar 1969. 19 p, 10 fig, 5 tab, 51 ref.

Descriptors: *Water chemistry, *Groundwater, *Brines, *Oklahoma, Groundwater basins, Geochemistry, Chemical reactions, Equilibrium, Aqueous solutions, Saline water, Saline water systems, Aquifers, Connate water, Solutes, Ions, Diagenesis.
Identifiers: *Anadarko Basin (Okla), Iodide concentrations.

A study was made to determine the geochemical relationships between the subsurface fluids and some of the geologic strata in the Anadarko Basin, Oklahoma. Samples of brines, cores, and petroleums from Pennsylvanian and Mississippian age sediments were analyzed. The brine samples from Mississippian and Pennsylvanian age sediments in the northern Oklahoma Platform area contain the highest concentration of iodide ever recorded. The brines, a Na-Ca-Cl type, probably have undergone diageneses such as dolomitization. The Br concentrations of these brines indicate that they probably are relict. Some of the brines were in equilibria with sandstones, some with dolomites, and some with limestones. Compared to sea water concentrated by solar evaporation, most of these brines are enriched in Br, Ca, Li, Sr, and I, and depleted in Mg, and K. Most of the brines from Mississippian age sediments are enriched in B, and most from Pennsylvanian age sediments were depleted in B. The high concentrations of I in these brines is attributed to concentration by shallow water fauna and flora, preserved by rapid sedimentation. Additional concentration of I in these brines occurred during diagenesis. (For main entry see W69-06950.)
W69-06958

MINOR ELEMENTS IN OIL-FIELD WATERS,
Shell Develop Co., Houston, Tex.; Du Pont de Nemours (E. I.) and Co., Wilmington, Del.; and Perkin-Elmer Co, Silver Spring, Md.
Gordon Rittenhous, Robert B. Fulton, III, Robert J. Grabowski, and Joseph L. Bernard.
Proc of Symp on Geochem of Subsurface Brines, Kansas Univ, Mar 25-26, 1968. Chem Geol, Vol 4, No 1-2, pp 189-209, Mar 1969. 21 p, 8 fig, 5 tab, 31 ref.

Descriptors: *Geochemistry, *Groundwater, *Oilfields, *Trace lements, Aqueous solutions, Equilibrium, Chemical reactions, Solutes, Ions, Ion exchange, Saline water, Connate water, Spectroscopy.
Identifiers: *Oil-field waters, Minor elements.

The minor element composition of 823 oil-field water samples from the United States and Canada was determined spectrochemically. In these samples the determined concentrations have a wide range but commonly are K and Sr, over 100 ppm; Al, B, Ba, Fe, Li, and Si, 1.0-100 ppm; Cr, Cu, Mn, Ni, Sn, Ti, and Zr in the ppb range in most waters; and Be, Co, Pb, V, W, and Zn, in the ppb range in some waters. When differences in total dissolved solid contents are eliminated by calculation, Cr, Li, Mn, Si, and Sr are commonly more than twice as abundant as in present sea water; Cu, K, Ni, and Sn are commonly less than half as abundant. Si content appears to vary between areas, between formations in the same area, and inversely with total solids content in the same formation. Relationships in the variation of other minor elements is more difficult to establish, partly because the minor elements, if actually present, were below detection limits and partly because spectrochemical method was not of high precision. Extensive changes in pH of many waters occurred between collection and analysis. Because of this and changes that may occur between subsurfaces and surface, quantitative interpretation of geochemical relationships between water and rock composition will be difficult. (For main entry see W69-06950.)
W69-06959

GEOCHEMISTRY AND ORIGIN OF FORMATION WATERS IN THE WESTERN CANADA SEDIMENTARY BASIN, 2. ALKALI METALS,
Louisiana State Univ., Baton Rouge; Research Council of Alberta, Edmonton; and Alberta Oil and Gas Conservation Board, Edmonton.
Gale K. Billings, Brian Hitchon, and D. R. Brian.
Proc of Symp on Geochem of Subsurface Brines, Kansas Univ, Mar 25-26, 1968. Chem Geol, Vol 4, No 1-2, pp 211-223, Mar 1969. 13 p, 5 fig, 2 tab, 22 ref.

Descriptors: *Geochemistry, *Water chemistry, *Groundwater, *Alkali metals, Groundwater basins, Solutes, Potassium, Sodium, Ion exchange, Membrane processes, Clays, Filtration, Connate water, Chemical reactions.
Identifiers: *Canada, Western Canada sedimentary basin, Lithium, Rubidium.

The population statistics for Cl, Br, I, bicarbonate, sulfate, Na, Ca, Mg, K, Rb, Li, Sr, Mn, Zn, Fe, Ni, Co, Cr and Cu in formation waters from the western Canada sedimentary basin are presented, together with weighted mean composition. Five types of formation waters are present in the basin but only 2 are considered in detail: (1) a membrane-concentrated formation water; and (2) a formation water formed either by mixture of 1 and very small amounts of bitterns resulting from halite precipitation or by hyperfiltration. Investigation of the alkali metals indicates that the membrane is selective and leads to a pattern of relative concentration in the decreasing order: Rb; K; Na; Li. The movement of alkalies through the filter is primarily by sitehopping and the relative rate is controlled by the ion's ease of replacibility in the decreasing order: Li; Na; K; Rb. The composition, and thus ion-ratios, are set by mineral-solution reactions, particularly during early diagenesis. Modification of the composition then occurs by selective filtration, further chemical reaction, and mixing during the subsequent fluid migration resulting from hydrodynamic drive. (For main entry see W69-06950.)
W69-06960

SOME CHEMICAL ALTERATIONS OF SUBSURFACE WATERS DURING DIAGENESIS,
University of Southern California, Los Angeles. Dept. of Petroleum Engineering.
George V. Chilingarian, and Herman H. Rieke.
Proc of Symp on Geochem of Subsurface Brines, Kansas Univ, Mar 25-26, 1968. Chem Geol, Vol 4, No 1-2, pp 235-252, Mar 1969. 18 p, 8 fig, 9 tab, 38 ref.

Descriptors: *Geochemistry, *Diagenesis, *Connate water, *Subsurface waters, Saline water, Brines, Oil fields, Solutes, Sea water, Chemical reactions, Equilibrium, Membrane processes, Ion exchange, Filtration, Compaction, Organic compounds.
Identifiers: *Oil-field brines, Pore waters, Oxygen isotopes.

Pore waters in most of the petroliferous sedimentary basins may ultimately be derived from the sea. There is a striking similarity between the amino-acid spectra in the fossil brines and in present-day sea water. Similarities in solutes also point in this direction, yet systematic chemical differences exist between the ancient and modern connate waters. The changes may be caused by a variety of processes and mechanisms such as dissolution and precipitation, pH-Eh variations, microbial activities, base exchange, chemisorption, and dolomitization. The similarity between isotope characteristics of the oil-field brines and present-day sea water suggests that in many cases concentration has not been accomplished by syngenetic evaporation, but probably occurred as a result of compaction and ion filtration by charged-net clay membranes. Experimental results indicate that the mineralization of squeezed-out solutions progressively decreases with increasing overburden pressure, but in moving vertically through a thick shale sequence, could increase to levels found in oil-field brines; the Ca/Cl and Ca/Na ratios could, but not necessarily, also increase. The mineralization of interstitial solutions in shales should be less than that in associated sandstones. If water moves from a sandstone bed through a clay layer into another sandstone bed, the water in the latter bed may be less mineralized because of filtration through a charged-net clay membrane. (For main entry see W69-06950.)
W69-06961

INTERSTITIAL BRINES IN PLAYA SEDIMENTS,
Geological Survey, Washington, D. C.; Geological Survey, Carson City, Nev.; and Geological Survey, Menlo Park, Calif.
Blair F. Jones, A. S. Vandenburgh, A. H. Truesdell, and S. L. Rettig.
Proc of Symp on Geochem of Subsurface Brines, Kansas Univ, Mar 25-26, 1968. Chem Geol, Vol 4, No 1-2, pp 253-262, Mar 1969. 10 p, 4 fig, 1 tab, 11 ref.

Descriptors: *Water chemistry, *Brines, *Playas, Evaporation, Saline lakes, Saline water, Saline water systems, Chemical precipitation, Equilibrium, Solutes, Aqueous solutions, Lakes, Great Basin, Clays, Groundwater, Ion exchange.
Identifiers: *Playa sediments, Western U.S.

In many closed drainages in the Great Basin, the interstitial solutions of shallow, fine-grained playa deposits store a large quantity of dissolved solids and are often more concentrated than associated lakes and ponds. These interstitial fluids commonly have a distinctive ionic composition which sometimes cannot be explained by either simple mixing of surface and subsurface inflow or by evaporative concentration. At Abert Lake, Oregon, the interstitial solute concentrations increase with depth to values as much as 5 times greater than the lake. Where Na, Cl, and carbonate species constitute more than 90% of the solutes, Na/Cl ratios in the lake water are lower than in the lake bottom sediments and higher than in playa fluids, and Na/K ratios are highest in the fluids of lake bottom muds and lowest in playa fluids. In deeper playa profiles, interstitial Na/Cl tended to decrease with depth (5 ft maximum). Na/Cl ratios are indicative of total carbon dioxide in solution and the effects of organic decay in surficial sediments. These ratios, coupled with data on silica and bulk density, show that higher carbon dioxide content accompanying decay promotes silicate dissolution and hydrogen ion exchange, stripping alkalis from sediment which had preferentially absorbed K when entering the lake. On subsequent loss of pore fluid in the playa regime, silica initially released to solution in the lake environment is readsorbed on dissolution products. For main entry see W69-06950 (USGS)

GEOCHEMISTRY AND HYDRODYNAMICS OF THE PARADOX BASIN REGION, UTAH, COLORADO AND NEW MEXICO,
Geological Survey, Washington, D. C.; and Petroleum Research Corp., Denver, Colo.
Bruce B. Hanshaw, and Gilman A. Hill.
Proc of Symp on Geochem of Subsurface Brines, Kansas Univ, Mar 25-26, 1968. Chem Geol, Vol 4, No 1-2, pp 263-294, Mar 1969. 32 p, 9 fig, 3 tab, 29 ref.

Descriptors: *Water chemistry, *Hydrodynamics, *Saline water systems, *Groundwater basins, *Southwest U.S., Chemical reactions, Equilibrium, Ions, Solutes, Ion exchange, Membrane processes, Osmosis, Filtration, Groundwater movement, Aquifers, Aquicludes, Clays, Shales, Recharge, Potentiometric level.
Identifiers: Paradox Basin (Utah-Colo-N.M.).

The water chemistry and groundwater movement of the Paradox Basin in the 4 corners region of SW United States was studied using drill-stem-test samples and pressure charts. The direction of groundwater movement in all units studied in the Paradox Basin is principally southwestward. Sodium chloride type water predominates in Permian and pre-Permian rocks although Ca and Mg are commonly high in some areas. In places where the groundwater has less than 10,000 mg/l total dissolved solids, sulfate generally becomes important. A combination of chemical and hydrologic data indicates that the east flank of the Monument uplift is faulted at depth. East of the uplift, groundwater from Paleozoic aquifers is generally briny, about 35,000 mg/l whereas west of the uplift, groundwater from these aquifers is commonly fresh to slightly saline, about 10,000 mg/l. This pattern indicates a restriction of flow from west to east in the area of the uplift; the regional flow trend is diverted southward by the fault barrier at depth. Previous hydrologic and geochemical study of the San Juan Basin shows the existence of an osmotic flow system within Cretaceous strata. Jurassic horizons were assumed to be the outflow receptors of the membrane system. However, the known occurrence of briny groundwater in Pennsylvania and Mississippiam aquifers coupled with the high potentio-metric surfaces of these same units leads to the postulate that they, not the Jurassic, may be the outflow receptors for the entire membrane system. Proc of Symp on Geochem of Subsurface Brines, Kansas Univ, Mar 25-26, 1968. Grant No GA-1371 (NSF). Chem Geol, Vol 4, No 1-2, pp 295-301, Mar 1969. 7 p, 52 ref.

Descriptors: *Water chemistry, *Membrane processes, *Clays, *Shales, Osmosis, Adsorption, Ion exchange, Connate water, Saline water, Brines, Geochemistry, Filtration.
Identifiers: *Hyperfiltration, Kerogen.

The membrane properties of shales are caused by the electrical charge properties of their constituent clay minerals and organic matter. The clay minerals are cation exchangers at singly-charged sites and have a small anion exchange capacity by replacement of hydroxide ion. Kerogen is the main organic constituent, and may be as much as 2% by weight of shales. It is composed mainly of denatured humic acids which have cation exchange capacity in the carboxyl and hydroxyl groups. Amino acids have anion exchange capacity. Rates of passage of ions through shale membranes are determined by availability of ions, dissociation, non-ionic adsorption, relative adsorption of divalent and monovalent cations, and mass effects. Dissociation effects are probably the most important; the more highly associated species pass most readily. Common clays adsorb divalent cations in preference to monovalent species. Ions are preferentially adsorbed when differences of solute ionic potential and exchange-site ionic potential are minimum; Na should be hyperfiltrated preferentially to Li and Sr with respect to Ca in most clays. Increased temperature and concentration should decrease hyperfiltration. For main entry see W69-06950. (Knapp-USGS)

Identifiers: *Tabulation, Water quality data, Permian Basin.

Saline waters from formations of several geologic ages are being studied in a 7-county area in southeastern New Mexico and western Texas, including the northern and eastern margins of the Delaware Basin between the Guadalupe and Glass Mountains. Chloride-ion concentrations in water produced from rocks of various ages and depths were mapped in Lea County, New Mexico, using machine map-plotting techniques and trend analyses. Anomalously low chloride concentrations (1,000-3,000 mg/l) were found along the western margin of the Central Basin platform in the San Andres and Capitan Limestone Formations of Permian age. These low chloride-ion concentrations may be due to preferential circulation of groundwater through the more porous and permeable rocks. Data were obtained principally from oil companies and from related service companies. Approximately 20,000 water analyses collected from over 65 sources were coded, recorded on punch cards and stored on magnetic tape for computer operations. Extensive manual and computer error checks for duplication and accuracy were made to eliminate data errors. The original 20,000 analyses considered were reduced to 6,000 representative analyses which are being used in the saline water studies. (USGS)

Identifiers: *Oil-producing rocks, Subsurface brines.

The concentration of deep subsurface brines of the chloride-calcium chemical type normally increases with depth. In many areas the increase is linear over thousands of feet vertically. The rate of increase ranges between 15,000 and 100,000 ppm/1,000 ft. In the Gulf Coast this relationship reverses at great depths. Here, however, the presence of abnormal fluid pressures indicates that processes of compaction and diagenesis are not yet complete. Any hypothesis to account for the chemical composition of these brines must explain the linear nature of the increase in concentration with depth.

DETERMINATION OF NITRATE IN ESTUARINE WATERS--COMPARISON OF A HYDRAZINE REDUCTION AND A BRUCINE PROCEDURE AND MODIFICATION OF A BRUCINE PROCEDURE,
Federal Water Pollution Control Administration, Metuchen, N. J. Hudson-Champlain and Metropotitan Coastal Comprehensive Water Pollution Control Project.
Lloyd Kahn, and Francis T. Brezenski.
Environmental Science and Technology, Vol 1, No 7, pp 488-491, June 1967. 2 fig, 2 tab, 18 ref.

Descriptors: *Chemical analysis, *Estuaries, *Nitrates, Nitrogen compounds, Colorimetry.
Identifiers: *Nitrate determination, *Hydrazine reduction procedure, *Modified brucine procedure, Estuarine waters.

Nitrate levels in estuarine waters were evaluated by hydrazine reduction and a brucine procedure. Low results were often obtained with the hydrazine procedure presumably due to depletion of available hydrazine by environmental components in the system, resulting in incomplete reduction of nitrate. The brucine method of Jenkins and Medsker was modified to provide a better behavior of the Beer-Lambert law. The modification involves carrying out the reduction step in boiling water, rather than at 20 deg C. Evidently the reaction kinetics are such that at the elevated temperature no break in the calibration curve is observed, the procedure resulting in the linearity of from 0 to 0.6 milligrams of nitrate-nitrogen per liter. The precision of the modified-brucine procedure was evaluated to be better than 0.03 milligram of nitrate-nitrogen per liter. (Konrad-Wis)

Descriptors: *Brines, *Saline water, *Classification, *Data processing, *Computer programs, Desalination, Chemical analysis, Chemical precipitation, Chemical properties, Salts, Aqueous solutions.
Identifiers: Chemical classification.

To study the utilization of waste brines from desalination, a method of classifying brines by chemical composition using a computer was developed, based on the chemical system in which the brines crystallize and the composition of the solid phases produced by crystallization. The 7-component system of Na, K, Mg, Ca, Cl, sulfate, and bicarbonate is divided into 3 quinary systems, each of which is completely described for computer processing by locating all invariant points, planes, and corner points of the solid phase regions. Descriptions of 1,552 brines useful as input to desalination plants are cataloged, sorted, and classified by a FORTRAN IV program. Flow charts describing the program are included. SALT ACCUMULATION PROCESSES IN THE HUNGARIAN DANUBE VALLEY,
Magyar Tudomanyos Akademia Talajtani es Agrokemiai Kutato Intezete, Budapest.
Gy. Varallyay.
Trans of 9th Int Congr of Soil Sci, Adelaide, Australia, Vol 1 of 4 vol, pp 371-380, 1968. 10 p, 4 fig, 1 tab, 14 ref.

Descriptors: *Saline soils, *Irrigation, *Alkaline soils, Salt tolerance, Impervious soils, Clays, Ion exchange, Soil structure, Soil chemical properties, Soil types, Saline water, Calcareous soils, Water table, Drainage, Groundwater movement, Evaporation.
Identifiers: *Hungary, *Danube Valley.

Many of the salt-affected soils of Hungary occur in the Danube Valley. Here the main causes of the formation and the low fertility of the solonchak, solonchak-solonetz and calcareous solonchakized solonetz soils are their high sodium bicarbonate and carbonate contents. Part of the rain water falling on the extensive catchment areas of the periphery of the Danube basin infiltrates into the soil and becomes enriched in calcium or sodium bicarbonates, depending upon the source rock material. This water moves towards the deeper parts of the adjacent subsurface drainage basin lined with the Pannonian substratum and then accumulates in the stagnant groundwater basin of the Danube Valley. At places where the static groundwater is within 2 m of the surface, evaporation from the groundwater greatly exceeds infiltration, especially during summer. This produces a concentration of salts in the groundwater. The alkaline-earth bicarbonates precipitate as insoluble carbonates. Only the easily soluble sodium salts remain in solution, migrate and become distributed in the soil profile according to their solubility. Ultimately salt accumulation horizons develop in the interzone of upward and downward water movement.

Descriptors: *Irrigation water, *Saline water, *Soil chemical properties, *Hawaii, *Hydraulic conductivity, Soil physical properties, Permeability, Soil water movement, Drainage, Leaching, Clays, Laterites.
Identifiers: Tropical soils, Latosols.

Relatively high levels of salinity and high proportions of sodium in irrigation waters may be tolerated if the soil allows sufficient downward movement of the large water applications necessary to prevent salt accumulation, and resists detrimental peptization. A tropical Red Earth and an Andosol were tested for these conditions using hydraulic conductivity measurements, employing solutions of sea water composition and homoionic solutions of Mg, Ca, and Na chlorides. Concentration of applied waters ranged from a high of 0.61 N to a low of 0.012 N in homoionic solutions and to 0.006 N for sea water. Subsurface soils maintained very high and essentially unchanged conductivities under all application. Under these conditions (at which many temperate zone soils are practically impermeable), infiltration values of 2.85 and 0.875 cm/hr were obtained for surface Tropical Red Earths and Andosols, respectively. Alternate applications of sea and distilled water caused slight structural changes even though the distilled water removed all soluble salts from highly sodium-saturated soils. It may be possible to increase the permissible limits of salinity and sodium in irrigation water for such soils. This finding has important implications in that these soils are widespread in tropical regions where additional sources of irrigation water are generally needed for effective development.

QUALITY OF IRRIGATION WATER,
Indian Council of Agricultural Research, New Delhi; and Punjab Agriculture Univ., Hissar (India).
J. S. Kanwar, and B. S. Kanwar.
Trans of 9th Int Congr of Soil Sci, Adelaide, Australia, Vol 1 of 4 vol, pp 391-403, 1968. 13 p, 1 fig, 5 tab, 24 ref.

Descriptors: *Irrigation water, *Water quality, *Saline water, *Soil chemical properties, Soil physical properties, Hydraulic conductivity, Permeability, Soil water movement, Drainage, Leaching, Clays, Soil types, Soil structure, Sodium compounds, Bicarbonates, Chlorides.
Identifiers: Salinity hazard, Sodium absorption ratio.

The effects of irrigation water containing 7.5, 22.5, 50.0 and 100 m-equiv/l of salt and sodium adsorption ratios of 4,8,16, and 26 on soil and crops were studied, applying 90 acre-inches of water to 2 crops of maize and 1 of wheat grown in succession. In a second experiment the effects of various levels of residual sodium carbonate (0.1, 1.25, 2.50 and 5.0 m-equiv/1) on the soil and crops were studied. It was observed that the yields of all crops decreased as the salt concentration of water increased. The germination of the 2nd crop of maize and 3rd crop, wheat, could not occur under the treatment of 200 m-equiv/1 of salts. A reduction in yield of 50% in the 2nd crop of maize occurred with a treatment of 50 m-equiv/1 of salts. The effect of increase of SAR of water on the crop yield was not so marked but the combined effect of electrolyte concentration and SAR was quite marked. The source of residual sodium carbonate, whether carbonate or bicarbonate, and the ionic composition of applied water are important. Moreover, it is the nature of the soil and the cumulative effect of a given water on the soil which will determine its effect on the crops. Triangular diagram methods involving the consideration of soil, water and plant may be used in determining the quality of water for irrigation purposes.

THE PROBLEM OF MAKING WASTE WATER SAFE AND ITS USE IN IRRIGATING LIGHT CHESTNUT SOILS IN THE POVOLZHYE AREA,
Volgograd Agricultural Inst. (USSR).
V. F. Shubin.
Trans of 9th Int Congr of Soil Sci, Adelaide, Australia, Vol 1 of 4 vol, pp 405-413, 1968. 9 p, 2 tab.

Descriptors: *Irrigation water, *Water reuse, *Municipal wastes, *Industrial wastes, Water quality, Sewage disposal, Irrigation design, Leaching, Soil-water plant relationships, Water spreading.
Identifiers: *USSR.

Test of flood-irrigation with combined municipal-industrial waste water were made to study infiltration, crop suitability, and salinity hazard of the water. Crops should be fast-growing and shade the soil well to retard evaporation and salinization. Rice and wheat are good early crops, and orchards and vineyards are profitable. Ground cover should be maintained because bare soil evaporation causes salinization. In the test plots there was no problem with salinization; in fact, there was a decrease of salinization and solonchak formation, and a flushing downward of salts. Irrigation of a plot at 3,000 cu m/ha in July 1965 resulted in 62% reduction of alkalinity, 69% Na, and 32% Cl, and a 24% increase in Ca and sulfates in the 0-50 cm layer. (Knapp-USGS)

SALINE SOIL CLASSIFICATION USING THE 5:1 AQUEOUS EXTRACT,
Centro de Edafologia y Biologia Aplicada del Segura, Murcia, (Spain).
O. Carpena, M. G. Guillen, F. G. Fernandez, and M. Caro.
Trans of 9th Int Congr of Soil Sci, Adelaide, Australia, Vol 1 of 4 vol, pp 483-490, 1968. 8 p, 1 fig, 3 tab, 14 ref.

Descriptors: *Saline soils, *Soil types, *Chlorides, *Electrical conductivity, Soil water, Irrigation, Drainage, Saline water, Irrigation water.
Identifiers: *Soil extracts.

Saline soils in SE Spain occupy 10,000 ha and the area is increasing because of improper irrigation techniques and the use of saline irrigation water. Soil salinity was determined by the use of soil extracts. Soil salinity and salinization maps were prepared. Chloride concentrations and electrical conductivity of the extracts were used in a diagram to classify soils. The relationship between salinity of extracts and chloride content was established by regression analysis of over 88 samples. (Knapp-USGS)

EVALUATION OF THE QUALITY OF IRRIGATION WATERS WITH HIGH BICARBONATE CONTENT IN RELATION TO THE DRAINAGE CONDITIONS,
Institute de Edafologia, Maracay (Venezuela). Facultad de Agronomia.
Ildefonso Pla.
Trans of 9th Int Congr of Soil Sci, Adelaide, Australia, Vol 1 of 4 vol, pp 357-370, 1968. 14 p, 3 fig, 4 tab, 12 ref.

Descriptors: *Irrigation water, *Bicarbonates, *Drainage, *Leaching, *Alkaline water, Return flow, Soil water, Soil chemistry, Soil structures, Sodium compounds, Saline soils, Alkaline soils.
Identifiers: *Venezuela, Sodium-bicarbonate water, Sodium hazard, Sodic soils.

In Venezuela, where most of the irrigation waters have a very high bicarbonate content, the actual and potential development of sodic and saline-sodic soils is a limiting factor for the permanence of a successfully irrigated agriculture. Data obtained in laboratory and greenhouse experiments, with very well controlled irrigation and drainage using different soils and waters of different composition were used as a basis for developing a logical and simple method for predicting the effects, and for calculating the leaching requirements to prevent the development of saline-sodic or sodic soils, when waters with high bicarbonate content are used for irrigation. The method is based on the separate calculation of the possible accumulation of the different ions in the soil solution. The influence of the leaching conditions on Na accumulation and structural deterioration was much more marked when waters with high bicarbonate content were used. With irrigation being the only supply of water, the effects on salts and Na accumulation were initially higher in the surface soil, decreasing with depth. These differences were more striking when the physical properties of the soil were favourable for the capillary rise of water. In both cases the Na accumulation was related to the existence of favourable conditions for calcium carbonate precipitation and concentration of salt in the soil solution.

THE SALTING FACTORS OF IRRIGATED SOILS IN THE TURAN PLAIN,
Akademiya Nauk Kazakhskoi SSR, Alma-Ata. Institut Pochvovedeniya.
V. M. Borovskiy.
Trans of 9th Int Congr of Soil Sci, Adelaide, Australia, Vol 1 of 4 vol, pp 473-481, 1968. 9 p, 19 ref.

Descriptors: *Saline soils, *Drainage, *Water levels, *Evaporation, *Irrigation, Water quality, Salts, Sodium compounds, Soil types, Chlorides, Groundwater movement, Climates, Arid lands.
Identifiers: *USSR, Turan Plain.

The Turan Plain occupies vast areas of the deserts in Central Asia and South Kazakhstan. More than 60% of the irrigated soils of the USSR are situated here. The climate is continental, with dry, hot and long summers, and short, frosty winters. Potential evaporation is 10 to 20 times larger than the average precipitation. The layer in which migration of the water-soluble salts takes place varies in depth from 100 to a few meters and consists of colluvial gravel covered with loess and alluvium of a binary structure derived from schists. The accumulation of salts in the soil, rocks and water is associated with the natural drainage. In the Piedment region where there is gravel and drainage is adequate, salts do not accumulate and there is no danger of secondary salinization. In the regions with less adequate drainage, there is an accumulation of salts, and secondary salinization is a danger after the development of irrigation. Very large quantities of salts have accumulated in the drainless alluvial-deltaic plains, where a high concentration of salts is found in the groundwater. On irrigation strong salinization takes place. Regulation of the water-salt system is necessary to prevent salinization. The salt reserves and the hydrologic properties of the entire layer from the surface of the soil to the water table must be taken into account.

WATER CONSERVATION IN THE SUBHUMID, NORTH LATITUDE PART OF THE CORN BELT OF UNITED STATES,
Agricultural Research Service, Morris, Minn. Soil and Water Conservation Research Div.
R. R. Allmaras, and R. F. Holt.
Trans of 9th Int Congr of Soil Sci, Adelaide, Australia, Vol 1 of 4 vol, pp 291-302, 1968. 12 p, 2 fig, 4 tab, 14 ref.

Descriptors: *Water conservation, *Water storage, *Soil water, *Corn belt, Surface-groundwater relationships, Soil-water-plant relationships, Irrigation, Supplemental irrigation, Crop production, Rainfall.
Identifiers: Soil water storage, Crop geometry.

The northwest Corn Belt of the United States is a subhumid area in which corn and soybean yields are often limited by water deficiency and early-season low temperature. With average midsummer rainfall, as much as 13 cm of water is used from soil storage. The probability of less than 13 cm of stored available water at planting is about 0.25. Soil storage of water was measured in each of 3 dormant-season and 2 growing-season periods. Storage predictions show quantative and systematic aspects of the storage model for each period and over the whole dormant season. Variation of plant spacing and use of temporary field windbreaks change water-use efficiency but do not produce measurable changes of evapotranspiration. Tillages that show both large evaporation (with ample supply of subsoil water) and infiltration rates also produce greater net storage even where no runoff occurs. Water distribution after intake cessation is suggested as a limiting factor for water storage. A tilled layer water storage model suggests limits on the possible value of tillage for increasing water storage.
W69-07141

THE EFFECT OF GYPSUM ON THE WATER STORAGE IN A SANDY LOAM SOIL UNDER AN IRRIGATED PERENNIAL PASTURE,
Commonwealth Scientific and Industrial Research Organization, Riverina (Australia). Riverina Lab.
B. J. Bridge, and C. R. Kleinig.
Trans of 9th Int Congr of Soil Sci, Adelaide, Australia, Vol 1 of 4 vol, pp 313-323, 1968. 11 p, 1 fig, 3 tab, 14 ref.

Descriptors: *Water storage, *Irrigation water, *Water yield improvement, *Soil treatment, Gypsum, Soil amendments, Ion exchange, Soil structure, Hydraulic conductivity, Permeability, Infiltration.
Identifiers: *Australia, Soil water storage improvement.

White clover (Trifolium repens L.) was grown at three irrigation frequencies with and without a top dressing of gypsum applied at 10 metric tons/ha, on a coarse textured soil which had a sandy loam A horizon of 15 cm depth underlain by a sandy clay B horizon of low hydraulic conductivity. Field measurements showed that gypsum application significantly increased the soil moisture storage before and after irrigation at all irrigation frequencies, but had no effect on the bulk density of the soil profile. Laboratory measurements showed that gypsum application increased the hydraulic conductivity of the subsoil, increased the exchangeable calcium in the soil profile, and decreased the exchangeable sodium plus magnesium. These soil changes were accompanied by significantly increased production of white clover. At a 7-day irrigation interval, the average growth rate rose from 18.0 to 43.4 kg/ha/day. At each irrigation frequency, the water increment in the soil profile at irrigation was similar for both gypsum and nil gypsum treatments, indicating that gypsum application resulted in an increased efficiency of use of applied irrigation water in terms of clover production.

WATER CAPTURE IN SOIL SURFACE MICRODEPRESSIONS FOR CROP USE,
Agricultural Research Service, State College, Miss.; and Agricultural Research Service, Watkinsville, Ga. Soil and water Conservation Research Div.
R. R. Bruce, D. L. Myhre, and J. O. Sanford.
Trans of 9th Int Congr of Soil Sci, Adelaide, Australia, Vol 1 of 4 vol, pp 325-330, 1968. 6 p, 1 fig, 1 tab, 4 ref.

Descriptors: *Water conservation, *Infiltration, *Cultivation, *Depression storage, Droughts, Southeast U.S., Crop production, Crop response, Surface-groundwater relationships, Runoff, Soil physical properties.
Identifiers: Soil surface roughening, Infiltration improvement.

Because the relatively abundant rainfall in the Southeastern United States is often unevenly distributed, water for plant growth may not be naturally sufficiently available at times when it is most needed by crops. This problem could be partly alleviated if a method were developed for retaining more rainfall for a longer time in the soil profile. Experiments compared rough and smooth soil surfaces on a Vertic Haplaquoll soil in Mississippi. The purpose of these studies was to investigate the possibility that a rough soil surface would increase surface detention of water and subsequent soil water supply for crop use. The rough surface was created by spading the interrow zone a few days after planting corn, the test crop; smooth surface plots were conventionally disked. In 1 of 2 years, the rough soil surface resulted in significantly greater corn yields. Associated with the yield increase was a larger amount of soil water in the profile during the critical water requirement period of meiosis and anthesis. It may be concluded that the greater depression storage capacity of the rough surface led to an increased amount of rainfall captured, infiltrated, and temporarily stored in the soil for plant use.

FLOOD COVERAGE: NEW CHALLENGE FOR INSURANCE.

J of Amer Ins, Vol 45, No 2, pp 13-16, Mar-Apr 1969. 4 p, 2 pic.

Descriptors: *Flood plain insurance, *Flood damage, Flood control, Flood protection, Risks, Cost sharing, Federal government, Local governments, Feasibility studies, Nonstructural alternatives, Disasters, Land use, Land development, Legislation, Legal aspects, State governments.

The struggle to provide a feasible insurance program to aid flood victims has been a long and difficult one. Steadily mounting flood losses have kept the idea of a flood insurance program alive. The activities of the Department of Housing and Urban Development, the National Association of Insurance Commissioners, and members of the property insurance industry have resulted in the National Flood Insurance Act of 1968 which authorized the Secretary of HUD to borrow up to $250 million to implement a flood insurance pro-

gram. The Act requires that state and local governments cooperate by adopting and enforcing land use provisions to restrict future development of land in flood-prone areas in order not to perpetuate the current problem. Under the program, flood insurance will be sold and claims serviced by private insurance companies. The federal government will assist property owners by paying a share of the determined premiums and providing reinsurance, which will be purchased by the companies as a means of protecting themselves and their policyholders against catastrophic losses. FLOOD PLAIN INFORMATION STUDY, JACKSON, TENNESSEE.
Corps of Engineers, Memphis, Tenn.

Corps Eng Flood Plain Rep, May 1967. 23 p, 5 plate, 3 photo, 35 ref, tech append. Prepared for Jackson Municipal Regional Planning Comm.

Descriptors: *Floods, *Flood damage, *Tennessee, Flood plains, Flood control, Non-structural alternatives, Maximum probable flood, Historic flood.
Identifiers: Forked Deer River (Tenn), Jackson (Tenn), Standard project flood, Intermediate regional flood.

Flooding of the South Fork of the Forked Deer River, North Fork Drainage Canal, and Bond Creek, Jackson, Tennessee is described in a report of flood plain problems based on records of rainfall, runoff, and historical and present flood heights. Maps, photographs, profiles, and cross sections indicate the extent of flooding that has occurred and which may be expected to occur in the future. The information is for use in study and planning ways to minimize vulnerability to flood damages by control of flood plain use by zoning and subdivision regulations, the construction of flood protection works, or by combinations of these approaches. HOLLIDAY V CITY OF GREENVILLE (ALTERATION OF NATURAL DRAINAGE CONDITIONS).

78 SE 2d 279-289 (S C 1953).

Descriptors: *South Carolina, *Surface drainage, *Storm drains, *Flood damage, Surface runoff, Damages, Erosion, Cities, Drainage, Floods, Repulsion (Legal aspects), Storm runoff, Surface waters, Outlets, Ditches, Discharge (Water), Legislation, Flow augmentation, Alteration of flow, Natural flow, Judicial decisions, Value, Drainage engineering, Drainage effects.

Respondent owned land situated in appellant city. Prior to 1950, drainage water from the surrounding public streets and respondant's land flowed over and off the land causing no harm. In 1950 appellant constructed curbs, gutters, and drainage basins which caused drainage water to be concentrated and discharged in greater volumes across respondent's land. This condition greatly reduced the value of respondent's tract. A statute required the city to provide adequate drainage, and such drainage was to be provided along a public thoroughfare, not over private land adjacent thereto unless the owner consented. From a judgment for respondent, the city appealed. The court held that the damage to respondent's land resulted from destruction of the natural drainage by the city's employees. The court noted that a city is not necessarily liable for damage from a change in a drainage system; it is liable, however, if the natural drainage is destroyed. The measure of damages in such a case is not the increase in amount of water flowing on the land; rather, it is the amount of damage from the increase in flow with due regard for the adequate drainage prior to the change. (Helwig-Fla)

COSTANZO V STATE (CONTROL OF SURFACE WATERS AND THE NATURAL FLOW DOCTRINE).
207 Misc 242, 137 NYS 2d 878-885 (N Y Ct Cl 1955).

Descriptors: *New York, *Natural flow, *Flood damage, *Surface waters, Excessive precipitation, Obstruction to flow, Judicial decisions, Drainage, Ditches, State governments, Surface runoff, Pipes, Culverts, Muck lands, Construction, Surface drainage, Drainage water, Storm runoff, Floods protection, Highways, Legal aspects.
Identifiers: Proximate cause.

Plaintiffs brought suit to recover for flood damage allegedly caused by defendant's construction of a highway. Plaintiffs could only recover if they showed that defendant collected a body of surface water which would not naturally flow toward plaintiffs' lands, and further, that such waters were cast upon plaintiffs' lands. On the basis of substantial expert testimony, the court entered a judgment in favor of the defendant. The evidence indicated that defendant was not negligent and, in fact, that it was careful to design its highway in such a way as to take advantage of the natural flow of surface waters. Defendant did not alter the natural flow but merely increased its volume; for this there is no liability. The court further found that the flooding of the plaintiffs' land was caused by excessive precipitation, thus breaking the causal connection between defendant's activities and the ultimate damage to the plaintiff. HURD V STATE (NEGLIGENT DISCHARGE OF CANAL WATER).

64 NYS 2d 896-902 (Ct Cl 1946).

Descriptors: *New York, *Flood damage, *Floodgates, *New York State Barge Canal, Flooding, Damages, Judicial decisions, Streams, Canals, Orchards, Legal aspects, Obstruction to flow, Ice, State governments, Barriers, Diversion, Discharge (Water), Prescriptive rights, Easements.
Identifiers: Res ipsa loquitur, Presumptions.

Plaintiffs sought to recover for damages allegedly caused by the State of New York when barge canal gates were opened and water was discharged into a frozen creek which subsequently overflowed and damaged plaintiffs' cherry trees. The state did not have a prescriptive right to flood plaintiffs' land. Plaintiff contended that the state was negligent in allowing the canal water to rise to abnormal height before discharging and in opening all the canal gates simultaneously so as to discharge unnecessarily large volumes of water into the stream. The court held the state liable, applying the doctrine of res ipsa loquitur since the barge canal gates were in the exclusive control of the state, the evidence showed the accident would not have occurred without negligence, and no explanation was forthcoming from the state. ALTERATION OF HIGHWAYS.

Conn Gen Stat Ann sec 13a-128, 13a-136, 13a-138 (1958), as amended, (Supp 1968).

Descriptors: *Connecticut, *Surface drainage, *Reservoir construction, *Flood control, Legislation, Highways, Road construction, Dike embankments, Dams, Diversion structures, Flood protection, Drainage water, Controlled drainage, Cost allocation, Cost-benefit ratio, Reservoirs, Tidal effects, Overflow, Water supply, Cities, Highway relocation.

Any municipal or private corporation which provides a town's water supply may, if necessary, apply to the governing council of any town to have the use of any public highway discontinued or altered in order to enable it to construct or enlarge a reservoir. If the council denies the application or fails to act upon it for thirty days, the corporation may petition the superior court, stating that such discontinuance is essential to the public interest. Whenever a town lays out a public highway across lowlands which are susceptible to tide overflow and the highway is used as a dike to prevent such overflow, the owners may be assessed for the benefits; however, not more than one-half the cost of the highway shall be assessed to the owners. Any person authorized to construct or repair highways may drain any imposing waters onto private lands, but such drainage must be done in a manner causing the least damage. However, no drainage is allowed into the yard of any residence or areas used exclusively for the storage and sale of foods. (Stewart-Fla)

UNITED STATES V HUGHES (FLOWAGE EASEMENT).

408 F 2d 619-621 (6th Cir 1969).

Descriptors: *Tennessee, *Easements, *Tennessee Valley Authority Project, *Dams, Reservoirs, Backwater, Floods, Streams, Water level fluctuations, Riparian rights, Riparian lands, Proprietary power, Real property, Judicial decisions, Legal aspects, Flow.

The TVA brought action as grantee of a flowage easement to require the defendant landowner to remove certain house trailers situated within the boundaries of that easement. The easement was procured from the defendant's predecessor in title and was properly recorded in the year of its purchase. The purpose of the easement was to provide the TVA with the permanent right to overflow the area with backwater impounded by a dam across the Watuga River. The court found that the house trailers had become immobile structures on the easement and that their presence materially violated the purpose of the easement. The court noted that the TVA purchased the easement for the purpose of flood control and that this objective could hardly be accomplished if the area into which flood waters were to be diverted had private dwellings thereon. The court held that the defendant had constructive notice of the recorded easement and remanded the case to the district court for further proceedings. (Katz-Fla)

OBSTRUCTIONS.
W Va Code Ann sec 17-16-1 (1966), as amended, (Supp 1968).

Descriptors: *West Virginia, *Obstruction to flow, *Drainage water, *Diversion structures, Ditches, Channels, Legislation, Drainage, Administrative agencies, Surface drainage, Alteration of flow, Natural flow doctrine, Watercourses, Surface runoff, Drainage systems, Barriers, Abatement, Highways, Legal aspects.
Identifiers: Injunctions (Prohibitory).

'Obstructions,' within the meaning of the statute, include ashes, earth, stone or other material placed on a public road, or in any ditch or waterway along such road. Water diverted from its regular course or channel so as to injure or endanger a public road is an obstruction. Also included within the definition of an obstruction is any road connected without lawful authority to a public road so as to obstruct or impede the flow of water in drains alongside the road. Such obstructions are declared to be public nuisances, and the county court or State Road Commission may apply to a court of competent jurisdiction for an injunction to abate such nuisance. (Stewart-Fla)
W69-07216

SLACK-WATER DAMS (NATURAL RESOURCES ACT).

W Va Code Ann sec 20-5-6 through 20-5-13 (1966).

Descriptors: *West Virginia, *Natural resources, *Water conservation, *Dams, Ponds, Rivers, Lakes, Surface waters, Bridges, Culverts, Highways, Road construction, Water storage, Reservoirs, Dam construction, Damsites, Legal aspects, Legislation, Project planning, Administrative agencies, Water supply, Cost allocation.
Identifiers: *Slack-water dams.

The Director of the Department of Natural Resources may request the State Road Commissioners to construct and maintain slack-water dams in connection with construction of public highways, bridges, culverts, or viaducts. The purpose of the slack-water dams is to create reservoirs, ponds, water parks, basins, lakes, or other incidental works to conserve the water supply of the state. Upon approval by the public authority in charge of construction, the director, state road commissioner, and the authority shall cooperate in formulating plans and in distributing costs for the dam construction. Any department of state government, county, city, park board, organization, corporation, or person may petition for construction of slack-water dams. The Director may review such petitions. The Director is responsible for supervision and care of all slack-water dams and reservoirs, ponds, basins, and lakes created by the dams. The projects may be maintained by leasing operators, but title to or lease of the lands and waters, and related riparian rights will otherwise be retained by the Division. Plans for new highways and bridges are to be coordinated with existing projects. (Kelly-Fla)
W69-07220

UNITED STATES V VIRGINIA ELECTRIC AND POWER CO (COMPENSATION FOR GOVERNMENT CONDEMNATION OF A FLOWAGE EASEMENT).

365 U S 624-645 (1961).

Descriptors: *Federal government, *Easements, *Condemnation value, *Navigable waters, Eminent domain, Compensation, Legal aspects, Land tenure, Project planning, Water utilization, Hydroelectric plants, Flow, Judicial decisions.
Identifiers: *Flowage easements, *Dominant servitude, *Roanoke River, *Subservient fee, Navigational servitude.

Under congressional authorization of a dam project, the federal government acquired a flowage easement over a tract of land. Respondent power company held a flowage easement over a tract within the tract appropriated by the government, and its easement was destroyed by the appropriation. In condemnation proceedings in district court, respondent received substantial damages. The court of appeals affirmed. On appeal to the U S Supreme Court the government claimed that respondent's easement had no compensible value when appropriated by the United States. The Supreme Court held that although the government had a 'dominant navigational servitude' to appropriate navigable waters to its use without compensation, no such right extended to fast lands. Compensation for fast lands taken by the government must be based on possible use not connected with the flow of the navigable stream appropriated. The Court felt the value of respondent's easement equaled the value of the subservient fee, since it had complete destructive control over the fee. The Court felt the value was the 'nonriparian' value of the servient land discounted by the improbability of the easement's exercise, with no weight given the

prospect of government appropriation. The cause was remanded for redetermination of damages. Three justices dissented in favor of the government view. (Harris-Fla)
W69-07221

CONNECTICUT RIVER FLOOD CONTROL COMMISSION.

Conn Gen Stat Ann sec 25-99 (1960).

Descriptors: *Connecticut, *Legislation, *Interstate compacts, *Interstate rivers, Interstate commissions, New Hampshire, Vermont, Massachusetts, Dams, Hydraulic structures, Reservoirs, Dikes, Levees, Flood protection, Flood control, Runoff, Public health, Public benefits, State governments, Water resources development, Federal government, United States, Streams, Hydroelectric power, Recreation, Water supply, Watersheds (Basins), Government finance, Taxes.

The Connecticut River Valley Flood Control Commission was established by this interstate compact to assure adequate storage capacity for impounding the waters of the Connecticut River and its tributaries in order to insure the protection of life and property from floods. The twelve member Commission is a politico-corporate entity endowed with full legal personality. New Hampshire, Vermont, Massachusetts, and Connecticut are equally represented on the Commission. The compact recognizes that construction by the United States of dams and reservoirs along the river valley will result in removal of certain lands from the tax rolls of the situs state. In order to compensate for tax losses, the compact provides that the states benefitted by such construction shall reimburse the situs state for a fixed percentage of such loss. Upon request of the governor of the damaged signatory state, the Commission shall assess the loss based on the current tax rate and request the appropriate state to make payment. A lump sum settlement may be negotiated by the Commission between the signatories involved. The Commission is also directed to undertake water control studies in coordination with the Corps of Engineers. (Katz-Fla)
W69-07222

MUNICIPAL FLOOD AND EROSION CONTROL BOARDS.
Conn Gen Stat Ann secs 25-84 to 25-86, 25-94 to 25-98 (1960), as amended, (Supp 1969).

Descriptors: *Connecticut, *Erosion control, *Flood control, Cities, *Local governments, Cities, Legislation, State governments, Federal government, Control structures, Construction, Assessments, Construction costs, Procurement, Condemnation, Administrative agencies, Eminent domain, Legal aspects.
Identifiers: Flood control systems, Inter-agency agreements, Inter-governmental agreements.

Any municipality may adopt the provisions of this section and exercise through a flood and erosion control board the powers granted thereunder. Such board may construct and maintain a flood or erosion control system and is authorized to acquire real property for such a purpose by sale or condemnation. Construction costs may be defrayed by bond issues, special assessments, or from general taxation. A board may enter agreements with the state, the United States, or both in order to satisfy conditions for systems improving navigation or for flood protection, provided such systems are approved by the water resources commission. The state may enter such agreements through the water resources commission which shall have direct control over plans and specifications. State contracts must be approved by the attorney general. Two or more municipalities may carry out projects jointly. Local authorities may accept gifts to be applied to such projects. (Kahle-Fla)
W69-07223

CARROLL V HOPPE (RIGHT OF A RIPARIAN OWNER TO CONSTRUCT A JETTY).

123 N Y S 2d 244-246 (N Y Sup Ct 1953).

Descriptors: *New York, *Riparian rights, *Navigable waters, *Jetties, Recreation, Fishing, Swimming, Bays, Beaches, High water mark, Tides, Naviagation, Water delivery, Water supply, Recreation demand, Public rights, Permits, Cities, Public lands, Legal aspects, Judicial decisions.
Identifiers: Injunctions (Mandatory).

Plaintiff and defendant were adjoining property owners. Plaintiff brought suit to compel defendant to remove a jetty which he had constructed over the foreshore fronting of his property and extending outwards from the high water mark. Defendant had received a permit to build the jetty for the purpose of protecting the water line which conducted the fresh water supply to his property. The foreshore over which the jetty was constructed belonged to the city which had granted the permit. The court held that defendant has the right as a riparian owner to build any structure on the foreshore of his land as long as he does not interfere with the public right of navigation, access to the water for fishing, bathing and other lawful purposes to which passage over the beach may be necessary. The court stated that the plaintiff failed to show that the jetty violated the rights of the public or that the jetty constituted a nuisance or an appropriation of public lands. The court awarded judgment for the plaintiff. (Shevin-Fla)
W69-07230

KENNEBEC TOWING CO V STATE (COLLISION WITH UNDERWATER OBSTRUCTION).

52 A 2d 166-171 (Me 1947).

Descriptors: *Maine, *Bridges, *Navigable rivers, *Boats, Piers, Transportation, Damages, Channels, Channel improvement, Rivers, Tides, Abatement, Underwater, Legal aspects, Judicial decisions, Accidents, Navigation, State governments, Currents (Water).
Identifiers: *Tugboats, *Obstruction to navigation, Towing, Negligence, Barges.

Plaintiff brought this action against the state for damages suffered by plaintiff's tugboat in a collision with an alleged underwater obstruction in the draw channel of a bridge. A jury awarded damages to the plaintiff, and the state moved for a new trial. The state contended that negligence by the captain of the tug was the direct and proximate cause of the accident. The court held that plaintiff had the burden of proving by a preponderance of the evidence that the accident was caused by defendant's negligence and that it was in no way contributorily negligent. The court declared the standard to be that of the reasonable prudent man. The court held that the state had to show that the jury's verdict was so manifestly incorrect as to necessarily have been attributable to prejudice or bias. The court stated that navigable rivers are common highways and may be used as any other highway is used. It may be negligence to have a concealed obstruction in a navigable channel. The duty of a tugboat captain is to exercise reasonable care, caution, and maritime skill. The court held that all the issues in the case were contested and that the jury was in the best position to weigh the facts and render an impartial verdict. The court upheld the jury verdict for plaintiff. (Shevin-Fla)
W69-07233

LOVIN V TOWN OF HAMLET (ATTRACTIVE NUISANCE DOCTRINE APPLIED TO ARTIFICIAL LAKE).

243 N C 399, 90 SE 2d 760-764 (1956).

Descriptors: *North Carolina, *Drowning, *Recreation facilities, *Lakes, Legal aspects, Hazards, Damages, Safety, Cities, Parks, Barriers, Judicial decisions, Dams.
Identifiers: *Attractive nuisance, *Wrongful death action, *Artificial lakes, *Negligence.

Defendant municipality created an artificial lake by damming; also constructed were a public park with a playground, wading pool, and other facilities, adjacent to the lake. Plaintiff's intestate, a boy of seven years, was alleged to have been attracted to the deep water of the lake where he subsequently drowned. Plaintiff alleged that the park and unfenced lake constituted an attractive nuisance of which defendant was aware, or through due diligence should have been aware. Thus, plaintiff charged defendant municipality with negligence in an action brought under a wrongful death statute. On appeal from denial of defendant's demurrer, the Supreme Court held that the complaint failed to state a cause of action on two points: it did not allege how, where, or under what circumstances the intestate fell into the water; it did not allege that children were accustomed to wade or play in and around the lake so as to put defendant on notice. The court held it was not negligence per se to maintain an unenclosed pond. The court also held that the attractive nuisance doctrine could not be applied to the park facilities under the circumstances since no inujury occurred on the facilities. (Harris-Fla)
W69-07236

UNITED STATES V FEDERAL POWER COMMISSION (FEDERAL POWER COMMISSION AUTHORITY OVER PROJECT LICENSING).

191 F 2d 796-809 (4th Cir 1951).

Descriptors: *Federal project policy, *Federal power act, *Hydroelectric project licensing, *Flood control, Legal aspects, Dams, Federal government, Permits, North Carolina, Judicial decisions, Dam construction, Water resources development.
Identifiers: *Roanoke Rapids project, *Federal Power Commission, *Flood control act of 1944.

Petitioners (Secretary of Interior and a cooperative electric company) sought an order setting aside the grant of a license by the Federal Power Commission to a private power company to construct a dam on the Roanoke River. Petitioners contended the FPC cannot grant such a license because the Flood Control Act of 1944 removed that power from FPC control. The court of appeals held that the Secretary had no power to determine when the development of water resources should be undertaken by the United States and withheld from private companies; only Congress and its delegate, the FPC, were charged with that power. The Secretary had no authority to intervene on behalf of the United States in these matters. Under the Federal Power Act, the FPC may issue licenses and thereby regulate water development. Only when Congress expressly or impliedly removes a project from FPC jurisdiction is this power limited. The FPC approved the general Flood Control Act but did not put the project completely under federal control. The court held that the general plan was to be supplemented by discretionary licensing by the FPC--not completely relegated to United States control. (Harris-Fla)

UNITED STATES V GENERAL BOX CO (CONDEMNATION OF LAND FOR LEVEE PURPOSES).

224 F 2d 7-21 (5th Cir 1955).

Descriptors: *Louisiana, *Eminent domain, *Levees, *Compensation, Mississippi River, Federal government, Navigable waters, United States, Rivers, Lumber, Condemnation, Public lands, Dikes, Flood control, Administrative agencies, Judicial decisions, Riparian land, Legal aspects, Relative rights, Right-of-way, Land, Beds.
Identifiers: *Riparian servitudes.

LIBRARY OF THE URBANA CHAMPAIGN

Plaintiff was the owner of timber located on land used by the United States to enlarge a levee on the Mississippi River. The state levee board exercised a riparian servitude to acquire the land for levee purposes and then donated the land to the United States in accordance with a state statute and the state constitution. The owners of the land were notified but plaintiff was not. The United States, through its servants, entered the land and destroyed the timber. Plaintiff brought action to recover the value of the timber. From a judgment for plaintiff in the trial court, the United States appealed. The circuit court held the United States was not liable for the timber because it had received the right-of-way from the state which had correctly appropriated the tract, without compensation, under a riparian servitude. The property was not taken by expropriation; rather, a public use was made of a public right-of-way. No notice was required to be given to plaintiff. In addition, the court found that the timber had been located on batture and that the constitution did not allow payment for destruction of batture or of timber located thereon. (Helwig-Fla)
W69-07242

GENERAL BOX CO V UNITED STATES (RECOVERABLE DAMAGES FROM LEVEE CONSTRUCTION).

107 F Supp 981-988 (W D La 1952).

Descriptors: *Louisiana, *Levees, *United States, *Eminent domain, Damages, Mississippi River, Judicial decisions, Legal aspects, Public benefits, Remedies, Riparian land, Flood control, Trees, Construction, Administrative agencies, Right-of-way, Federal government, Compensation, State governments, Condemnation.
Identifiers: Due process (Procedural).

Plaintiff owned timber land on the Mississippi River which was destroyed by defendant's enlargement of a levee on the main stream. The Fifth Louisiana Levee District had agreed, in compliance with the Flood Control Act, to obtain rights-of-way along the river for the United States. The district failed to comply with the strict guidelines of the state constitution and statutes which dealt with the procedures to be followed in taking lands for levee purposes. As provided by state statute, if the owner and the district disagree on the price to be paid for the owner's property, a trial on the issue should be held. Plaintiff disagreed as to the price to be paid for his timber, and no trial was held. Plaintiff then sought to recover the price of the timber from the federal government. The court allowed plaintiff's claim. The court based its decision on the Fifth Amendment to the Federal Constitution which prohibits the taking of property for public use without just compensation. Even though the rights-of-way were issued to the defendant by the levee district, if they were invalid, the defendant is liable. (Holt-Fla)

CENTRAL NEW YORK BROADCASTING CORP V STATE (SUIT TO RECOVER DAMAGES FOR NEGLIGENCE OF STATE IN FLOOD CONTROL PROJECT).

206 Misc 101, 132 N Y S 2d 12-15 (Ct Cl 1954).

Descriptors: *New York, *Flood control, *Channel improvement, *State jurisdiction, State governments, Federal government, Drainage districts, Levees, Drainage systems, Floodwater, Flood damage, Overflow, Erosion, Obstruction to flow, Water spreading, Rain, Channels, Surface runoff, Legal aspects, Judicial decisions, Flow augmentation, Construction, Excessive precipitation.

Plaintiff brought this claim to recover for damage sustained by reason of the alleged negligence of the State of New York in carrying out a flood control project. The construction of a new channel to carry water resulted in the formation of a bottleneck in the old channel. Work stopped for a time on the new channel, and when the annual spring floods came the old channel was unable to carry water as it had in the past. This resulted in an overflow of great quantities of water running at a rapid rate to a lower level. This swift running water eroded much of plaintiff's property. The court affirmed a finding that the state was negligent in its construction of the outlet from the channel. The state was held liable for damages because it owned the land used for the project, the plans for construction were defective, and the work was inherently dangerous. Furthermore, the court held that even though this was a joint venture involving the state and federal governments, the state's responsibility could not be delegated. (Logan-Fla)

PERKINS V PALO ALTO COUNTY (SUIT FOR INJUNCTION REQUIRING COUNTY TO CONSTRUCT A CULVERT).

60 NW 2d 562-566 (Iowa 1953).

Descriptors: *Iowa, *Watercourses (Legal), *Culverts, *Highways, Roads, Graded, Surface drainage, Surface waters, Alteration of flow, Natural streams. Ditches, Drainage systems, Floods, Local governments, Legal aspects, Judicial decisions, Remedies, Damages, Land tenure, Diversion, Road construction.
Identifiers: Injunctions (Mandatory).

Plaintiff landowner brought this suit seeking a mandatory injunction requiring defendant to put a culvert through road adjacent to plaintiff's land so as to divert water into a natural watercourse. Defendant had constructed a road which blocked the natural course of surface waters across property subsequently purchased by plaintiff and had diverted that water along a road ditch running around the property. Plaintiff's predecessor in title had requested that this ditch be constructed and acquiesced in its use. When plaintiff bought the property, he knew of the old watercourses as well as the existing ones. The court ruled that the roadside ditch had become the natural watercourse and that plaintiff was not entitled to have a culvert constructed through the road in order to divert water back into the old watercourse. The court further held that the fact that watercourse would flood plaintiff's property if debris was not removed from the channel would not support an order for construction of a culvert. (Logan-Fla)
W69-07245

UNITED STATES V DICKINSON (SUIT TO RECOVER VALUE OF LAND FLOODED BY THE FEDERAL GOVERNMENT).

331 U S 745-751 (1947).

Descriptors: *West Virginia, *Flooding, *Condemnation, *Public rights, Dams, Eminent domain, Cost repayment, Soil erosion, Damages, Flood damage, Land reclamation, Easements, Judicial decisions, United States, Federal government, Developed waters, Water resources development, Compensation, Condemnation value, Landfill.
Identifiers: Statute of limitations.

Plaintiff brought this suit to recover for the value of easements taken by the federal government. Without condemning land, the government built a dam on a river and raised the water level so as to flood a part of respondents' land. More than six years after the dam was built, but less than six years after the water reached its highest level, respondents sued for compensation. The court held that they were not barred by the six years statute of limitations. When the government chooses to take land by physical processes rather than by condemnation, the owner is not required to resort to piecemeal or premature litigation to determine what is 'taken.' The court also held that when part of a tract is taken by flooding, compensation is due for any erosion to the remaining part of the tract proximately caused by such flooding. Compensation is payable in full for the amount of land taken even if the owner later, with the consent of the government, fills the land. The court found that the landowner was entitled to compensation for an easement for intermittent flooding above the new permanent water level. (Kelly-Fla)

GOODYEAR TIRE AND RUBBER CO OF ALABAMA, INC V GADSDEN SAND AND GRAVEL CO, INC (UNDERSEEPAGE AND WATER FLOWAGE).

27 So 2d 578-584 (Ala 1946).

Descriptors: *Alabama, *Repulsion (Legal aspects), *Riddance (Legal aspects), *Damages, Remedies, Percolation, Seepage, Underseepage, Underflow, Subsurface drainage, Soil moisture, Percolating water, Dams, Hydraulic structures, Mineral industry, Industrial water, Impounded waters, Ponds, Surface waters, Reservoirs, Flooding, Judicial decisions, Legal aspects, Easements, Prescriptive rights, Rainfall, Sands, Natural flow.
Identifiers: Statute of limitations.

Plaintiff brought this action against the owner of adjacent servient property for damages resulting from defendant's blockage of the natural flow of surface waters from plaintiff's land and for damages resulting from impoundment of water on defendant's land. Defendant built a dam on lands adjoining plaintiff's land. The dam prevented the natural flow of water from plaintiff's land and caused the saturation of the moulding sand located on plaintiff's property. The court held that the claim arising from blockage of the surface water flow was barred by the statute of limitations but held the allegations concerning impoundment of waters on defendant's property by construction of a dam constituted a cause of action for private nuisance. The court noted that the evidence disclosed that the nuisance arose from the maintenance of the dam, not its construction, and that, under Alabama law, damages for nuisance predicated on negligent maintenance are awarded as though the nuisance were abatable. The court therefore awarded damages only for the temporary injury caused plaintiff and not for any prospective damages. (Katz-Fla)
W69-07248

BURLEYSON V WESTERN AND ATLANTIC RR (OVERFLOW AS AN ABATABLE NUISANCE).

91 Ga App 745, 87 SE 2d 166-171 (1955).

Descriptors: *Georgia, *Overflow, *Culverts, *Remedies, Rainfall, Rainfall-runoff relationships, Damages, Judicial decisions, Flooding, Ditches, Depreciation, Railroads, Legal aspects.
Identifiers: *Nuisance (Abatable).

Plaintiff sought recovery for damage to his land allegedly caused by an inadequate drainage culvert maintained by defendant railroad. In times of heavy rain the culvert overflowed causing erosion on the land and thus depreciated the rental value of the land. The appellate court sustained the trial court's finding that plaintiff was not entitled to recovery for permanent damages, since the overflow constituted an abatable nuisance and plaintiff could not assume that the condition would continue indefinitely. The proper remedy should have been to bring from time to time separate suits for recurring injury. The measure of damages for continuing abatable nuisance is diminution of rental value during existence of the nuisance and not diminution in market value of the property. (Kahle-Fla)
W69-07249

GOUGH V GOBLE (OBSTRUCTION TO FLOW OF SURFACE WATER).

2 Ill 2d 577, 119 NE 2d 252-254 (1954).

Descriptors: *Illinois, *Obstruction to flow, *Surface waters, *Surface drainage, Floodwater, Surface runoff, Drainage water, Channels, Canals, Gullies, Judicial decisions, Water law, Legal aspects, Alteration of flow, Relative rights, Culverts, Barriers, Natural flow.

Plaintiff was awarded a mandatory injunction to compel defendants to remove an obstruction from their land which allegedly impeded the natural flow of water from plaintiff's land. When for more than forty years surface waters from an upper landowner's realty had passed through a culvert and flowed onto the lower landowner's land at a level two feet lower than the general surrounding ground, the lower landowner had no right to obstruct the culvert and to impede the flow of water, even though the landowner was merely restoring to its natural level land which had been lowered over the course of years by action of water from the culvert. (Dean-Fla)

STATE V GEORGE C STAFFORD AND SONS (BOUNDARY DISPUTE OVER FILLED IN LAKE SHORE).
105 A 2d 569-575 (N H 1954).

Descriptors: *New Hampshire, *Boundary disputes, *Land tenure, *Littoral, Riparian rights, Lakes, Great ponds, Equitable apportionment, Shores, Judicial decisions, Landfills, Land forming, Highway effects, High water mark, Legal aspects, Reasonable use, Legislation, Administrative agencies, Ownership of beds, State governments.
Identifiers: Estoppel.

While constructing a highway, the state extended the shoreline of a lake by filling in part of the bed. The fill was placed, with defendant's permission, adjacent to the shore bordering defendant's land. After the highway commissioner agreed that defendant would receive title to the filled land, defendant made improvements and added a wharf, all of which brought public complaints. The state filed this bill in equity to determine the boundary line between the state's and defendant's lands, and to remove the cloud from the state's title. The appellate court held defendant had no title since the commission lacked authority to grant it, and that the state, by statute, could not lose rights through estoppel. The court ruled a littoral owner may acquire land by filling in the shore only through legislative sanction, since beds of great ponds and lakes are held in trust by the state for the public. Furthermore, the court held the right to build wharves must be exercised reasonably so as to protect public interests, and allowed the lower court alternative to an equitable solution. (Wheeler-Fla)
W69-07252

STUART V LAKE WASHINGTON REALTY CORP (ACTION TO ENJOIN FLOODING OF PROPERTY BY RAISING LAKE LEVEL).

92 SE 2d 891-909 (Sup Ct App W Va 1956).

Descriptors: *West Virginia, *Dams, *Backwater, *Flood damage, Relative rights, High water mark, Design flood, Flooding, Land tenure, Easements, Judicial decisions, Legal aspects, Lakes, Lake shores, Impoundments, Water levels, Contracts.
Identifiers: Injunctions (Mandatory), Injunctions (Prohibitory), Estoppel, Balance of convenience.

Plaintiffs sued to enjoin defendant realty corporation from further flooding their lakefront property and to compel defendant to remove impounded waters. Plaintiffs contended the inundation resulted when defendant raised the lake's elevation by increasing the height of defendant's dam. The man-made lake was part of defendant's housing development, from which plaintiffs' land had been withheld. Defendant urged the use of the balancing of convenience doctrine, since lowering the lake level would reduce the value of the development, and would cause breaches of contract already made with lot purchasers. Defendant alternately claimed an implied easement to flood plaintiffs' land. The appellate court found that an implied easement must have been within the intention of the parties when conveyance was made, and that it must have been mentioned in the deed, or have been apparent, continuous, and necessary for the enjoyment of the land retained. In the instant case, no easement was mentioned in the deed nor was apparent in fact. The court further found that relative inconvenience to each party would not be balanced where the non-wrongdoing party would suffer substantial and irreparable injury, even though the wrongdoer will suffer greater injury. (Kelly-Fla)

CITIZENS COMM FOR HUDSON VALLEY V VOLPE (WAIVER OF THE DEFENSE OF SOVEREIGN IMMUNITY).

297 F Supp 809-814 (S D N Y 1969).

Descriptors: *New York, *United States, *State governments, *Hudson River, Streams, Surface waters, Highways, Roadbanks, Road construction, Landfills, Dams, Bridges, Transportation, Embankments, Scenic highways, Adjudication procedure, Legal aspects, Judicial decisions, Highway effects, Environmental effects, Damages, Remedies, Federal government, Engineering structures.

Plaintiffs brought this action against the state Commissioner of Transportation challenging the construction of the Hudson River Expressway. The defendant obtained permission from the federal government to construct the road. Permission was admittedly required since the proposed expressway would extend into and over the River. The plaintiffs' contended that the defendant had waived the defense of sovereign immunity in federal court by knowingly entering an area regulated by Congress pursuant to constitutional authority. The court held that this limitation on the defense of sovereign immunity only applied where a state had entered a sphere of operation subject to causes of action created by Congress in favor of a specific class (FELA claims). The plaintiffs in this case did not bring its action under a statute requiring a person to secure a federal permit prior to alteration of a navigable stream. Therefore, the defendant had not waived the defense of sovereign immuntity to an action at law. However, when a state official attempts to proceed under a statute claimed to be unconstitutional, he is stripped of his official character and may be enjoined from proceeding. (Katz-Fla)
W69-07195

CITIZENS COMM FOR THE HUDSON VALLEY V VOLPE (PRELIM INJUNCTION BARRING HIGHWAY CONSTRUCTION ALONG A NAVIGABLE STREAM).
297 F Supp 804-808 (S D N Y 1969).

Descriptors: *New York, *United States, *State governments, *Highways, Hudson River, Streams, Surface waters, Roadbanks, Road construction, Landfill, Dams, Bridges, Transportation, Embankments, Scenic highways, Adjudication procedure, Legal aspects, Judicial decisions, Highway effects, Environmental effects, Damages, Remedies, Federal government, Engineering structures.
Identifiers: Prereq for prelim injunction.

Plaintiffs applied for a preliminary injunction prohibiting the delivery of a permit authorizing the State of New York to begin landfill operations on the proposed Hudson River Expressway. The court held that the plaintiff had failed to demonstrate a reasonable probability of success at trial challenging the construction of the expressway. The court noted that the items of damage claimed by the plaintiff were highly conjectural and that adequate remedy at law existed. Further delay in commencement of construction would increase the project's cost. Therefore, the court denied the plaintiff's application. The plaintiff had contended that the expressway project was incorrectly treated by the Army and Interior departments as one requiring a mere permit. The plaintiffs argued that the project called for construction of dikes and causeways and therefore required consent of Congress. The court noted that the project would not substantially interfere with navigation and determined that plaintiffs' argument in this regard would be of no avail. (Katz-Fla)
W69-07196

IN RE APPROPRIATION OF EASEMENTS FOR HIGHWAY PURPOSES (COMPENSATION FOR DAMAGES CAUSED BY TAKING UNDER EMINENT DOMAIN).

163 NE 2d 181-186 (Ohio Ct App 1958).

Descriptors: *Ohio, *Eminent domain, *Subsurface waters, *Damages, Compensation, Easements, Springs, Underground streams, State governments, Administrative agencies, Groundwater movement, Highways, Road construction, Legal aspects, Judicial decisions, Condemnation.
Identifiers: *Underground reservoirs, *Adjacent landowners.

The Director of Highways instituted proceedings to acquire an easement through a tract of land on which several completed houses of a project were located. It appeared from the evidence that the excavation would release the water from a natural underground reservoir and cut off the only source of water available to the houses in the project. The court of appeals in affirming a judgment in the trial court appealed from by the Director held the governmental right of eminent domain was not analogous to that of an adjacent landowner, who can legally drill for water even at the risk of impairing his neighbor's supply. The requirement to compensate for a taking under eminent domain is absolute, regardless of forseeability. If the state is called upon to pay high damages, it may choose not to take. The court held compensation must extend to damage to adjacent property as well as that under the easement. The court further held evidence of rents paid on completed houses to be admissible as an element of fair market value. Finally, the court felt the resolutions and findings of the Director of Highways was admissible in evidence to help establish compensation. (Harris-Fla)

PERSIN V CITY OF YOUNGSTOWN (FLOODING OF LOWER TRACT DUE TO AIRPORT CONSTRUCTION).

92 NE 2d 237-244 (Ct App Ohio 1949).

LIBRARY OF THE URBANA CHAMPAIGN

Descriptors: *Ohio, *Surface waters, *Surface drainage, *Obstructions to flow, Floodwater, Surface runoff, Flooding, Drainage water, Drainage, Floods, Water law, Judicial decisions, Legal aspects, Snowmelt, Airports, Flow augmentation, Diversion, Alteration of flow, Reasonable use, Natural flow, Rainfall-runoff relationships, Relative rights, Cities, Construction.

Plaintiff brought action against defendant city for damages resulting from defendant's construction of an airport which allegedly diverted surface water from its natural course, accelerating and increasing the flow and causing flooding of plaintiff's land. A lower tenement is burdened with a servitude to receive all surface water accumulating from falling rain, melting snow or from natural springs that naturally flow from higher land onto the lower tract. The construction of an airport by the defendant city amounted to rightful and reasonable use of its land, and there was no evidence which demonstrated a direct causal connection between the construction of the airport and the flooding of plaintiff's land. The judgment for defendant was affirmed. (Dean-Fla)

FLANAGAN V GREGORY AND POOLE INC (UPSTREAM RIGHTS IN RE FLOW).
67 SE 2d 865-874 (W Va 1951).

Descriptors: *West Virginia, *Roadbanks, *Repulsion (Legal aspects), *Culverts, Streams, Riddance (Legal aspects), Real property, Natural flow, Obstruction to flow, Downstream, Coal mines, Strip mines, Judicial decisions, Legal aspects, Hydraulic structures, Dams.

Plaintiff sued the defendant corporation and the corporation's lessor for damage to plaintiff's land and buildings caused by flooding. The damage was caused by defendant corporation's erection and maintenance of an embankment for a roadway across the valley of a creek below plaintiff's land and an inadequate drainage culvert under such a roadway. The court, in passing on the propriety of the lessor's joinder, held that a landowner who permits a lessee to erect such a roadway and an inadequate culvert in a manner which impedes the flow of a stream is liable as a codefendant if the lessor acted in concert with the lessee. The court determined that the lessor leased the property to the lessee for the purposes of strip mining coal in pursuit of a common interest and upheld the joinder. (Katz-Fla)

COUSIN V HORNSBY (LANDOWNER IS RESTRICTED TO ACTION FOR DAMAGES ONCE RIGHT TO RESIST EXPROPRIATION IS WAIVED).
87 So 2d 157-163 (Ct App La 1956).

Descriptors: *Louisiana, *Appropriation, *Right-of-way, *Channel improvement, Judicial decisions, Preferences (Water rights), Priorities, Eminent domain, Damages, Value, Condemnation value, Land appraisal, Local governments, Contracts, Legal aspects.

Plaintiff sued defendant contractor for trespass and related damages to his land, trees, and flowing springs resulting from a contractor's dredging. The contractor was under contract to a subdivision of the State Public Works Dept to construct a drainage project. The state was to obtain rights-of-way prior to entry upon the land by the contractor. No right-of-way was ever obtained over the plaintiff's land, but information of this was not conveyed personally to the contractor, who entered upon the land and began work. The state authorities claimed that the contractor was liable for all damage caused by his own acts or omissions. The state claimed that the defendant had been notified of the lack of appropriation through one of his own agents. This court amended and affirmed a decision for the plaintiff. The state should reimburse the defendant for any judgments already paid to the plaintiff since it was the state which contracted for the work the contractor faithfully performed. The plaintiff knew his land was to be taken as part of the project yet did not sue until work was completed. By acquiescing in the taking of his land, and by not seeking injunctive relief before the damage was done, the plaintiff is now able to bring merely an action to recover the value of the land taken and damages to adjacent property. Blunt-Fla)

ORTEGO V CALDWELL (ACTION FOR DAMAGES DUE TO CROP FLOODING RESULTING FROM DEFECTIVE LEVEE).
87 So 2d 124-127 (La 1956).

Descriptors: *Louisiana, *Levees, *Earthworks, *Highway relocation, Judicial decisions, Damages, Flooding, Flood protection, Flood damage, Cost repayment, Standards, Road construction, Legal aspects, Contracts, Projects, Rain water, Surface runoff.
Identifiers: Agency, Independent contractors.

Plaintiffs brought this action for damages against defendant contractor alleging that defendant had improperly constructed a levee designed to prevent flooding of plaintiffs' land and crops via drainage from an adjoining highway. Plaintiff had permitted the state department of highways to destroy an old levee on plaintiffs' land in order to widen an adjoining highway. In return, the department had promised construction of a new levee to be built to the plaintiffs' satisfaction. Defendant contractor improperly constructed the levee so that several breaks occurred during heavy rains, resulting in crop damage to plaintiffs. The court permitted plaintiffs to sue defendant, as an independent contractor of the state, on the contract clause guaranteeing satisfaction. The court permitted a finding of liability in spite of the agency relationship with the state, holding that the state had not actually approved defendant's work. (Kelly-Fla)
W69-07262

GINTHER V LONG (ACTION FOR DAMAGES DUE TO TEMPORARY POLLUTION OF SOIL, RESULTING IN TIMBER LOSS).

87 So 2d 286-289 (Miss 1956).

Descriptors: *Mississippi, *Soil contamination, *Oil wastes, *Property values, Effluents, Compensation, Damages, Depreciation, Timber, Fouling, Judicial decisions, Legal aspects, Water pollution, Oil wells, Waste water (Pollution).

Appellee landowner brought suit for damages to his land and timber, alleging this resulted because appellant permitted deleterious effluents to flow on appellee's land from appellant's oil well, which operated on adjacent land. The state Supreme Court upheld appellee's claim, finding that salt water and oil from appellant's oil well operation caused injury to appellee's land and timber. The court held that appellant's certificate of compliance to the pollution regulations of the Fish and Game Commission was inadmissible as evidence of nonpollution, since it was issued after appellee's claim had matured. The court found, however, that appellee had been awarded excessive damages, because the pollution had caused temporary rather than permanent injury. The measure of damages in Mississippi for temporary injury is the depreciation in rental value of the property, not the depreciation in its market value. (Kelly-Fla)

PROVISIONAL ALGAL ASSAY PROCEDURE,
Joint Industry-Government Task Force on Eutrophication, New York.
G. P. Fitzgerald, Joseph Shapiro, C. R. Goldman, O. R. Armstrong, and Jack Myers.
Published by Joint Industry/Government Task Force on Eutrophication, P O Box 3011, Grand Central Station, New York, 62 pp, Feb 1969. 7 fig, 5 tab, 26 ref.

Descriptors: *Algae, *Bioassay, Nutrients, Eutrophication, Water pollution effects, Water pollution sources, Bioindicators, Nitrogen fixation.
Identifiers: *Algal growth, Nutrient availability, Algal growth potential, Selenastrum capricornutum, Anabaena flos-aquae, Microcystis aeruginosa, Algal cultures, Chemostats, Carbon-14.

The procedure described was developed by a team of international experts under the sponsorship of the Joint Industry/Government Task Force on Eutrophication and represents the first step toward developing reliable and reproducible tests to determine the capacity of various aquatic environments to grow algae. It is emphasized that the procedures presented are provisional and are not standardized tests. Three procedures are described: a bottle test, a continuous-flow chemostat test, and an in situ test. Detailed descriptions of equipment required, laboratory procedures, analytical techniques, and sample preparation are given. Indicator organisms selected for use in the tests are Selenastrum capricornutum, a green alga; Anabaena flos-aquae, a blue-green alga capable of fixing nitrogen; and Microcystis aeruginosa, a blue-green alga not capable of fixing nitrogen. Descriptors: *Chemical analysis, *Pesticides, *Analytical techniques, Chromatography, Gas chromatography, Aromatic compounds, Organic compounds, Organophosphorus pesticides, Photometry.
Identifiers: Pesticide analysis.

The detection of organic pesticides in aquatic environments is unique in that specificity is required under extremely sensitive conditions as opposed to gross analysis for trace organics in water. First, there is the problem of pesticide identification. Second, direct measurement is not feasible because of sensitivity and specificity requirements. Extraction, concentration, and cleanup techniques must be employed prior to qualitative analysis and quantification. Third, natural waters may contain such organic interferences as aromatic and aliphatic compounds from industrial waste waters, and naturally occurring colored compounds. These impurities are often present in concentrations greater than the pesticide. A brief critique of extraction, cleanup, identification, and quantification techniques is given to emphasize limitations, fallacies, and pitfalls. A model system is outlined for the recovery, separation, and confirmation of organophosphate pesticides, oxons, and their hydrolysis products. This model system provides by liquid-liquid extraction, separation by gas-liquid chromatography, and subsequent confirmation by micro-ultraviolet absorption spectrophotometry are discussed. DETERMINATION OF PHENOLS IN SURFACE WATERS BY THIN-LAYER CHROMATOGRAPHY,
Federal Water Pollution Control Administration, Cincinnati, Ohio. Analytical Quality Control Branch.
Doris Smith, and J. J. Lichtenberg.
ASTM STP No 448, Symp on Microorganic Matter in Water, Aner Soc Testing Mater 71st Annu Meeting, June 23-28, 1968, San Francisco, pp 78-95, Feb 1969. 18 p, 9 fig, 5 tab, 29 ref, 1 append.

Descriptors: *Analytical techniques, *Phenols, *Chemical analysis, *Chromatography, Water pollution, Pollutants, Pollutant identification, Surface waters.
Identifiers: *Thin-layer chromatography.

Thin-layer chromatographic procedures for the determination of phenol and certain substituted phenols are applied to raw surface waters. Both water grab and carbon adsorption samples are analyzed. The concentrated solvent extracts of the samples are chromatographed on silica gel G thin layers and developed in benzene/cyclohexane/diethylamine (5:4:1) or chloroform. The first system provides for selective determination of the alkylphenols, since the chloro-, nitro- and aminophenols remain at or near the origin. Phenols developed with this system are detected with p-nitrobenzendiazonium, fluoroborate. Those developed with chloroform are detected with Gibbs' reagent. Specific phenols are characterized by their Rf values and the color of the spots produced. A wide variety of phenols are detected at the 0.1 to 10 microgram level with the Gibbs' reagent and at the 0.5 microgram level with p-nitrobenzenediazonium fluoroborate. (For main entry see W69-06968.)

California Univ., Davis. Inst. of Ecology.
Richard Armstrong, and C. R. Goldman.
ASTM STP No 448, Symp on Microorganic Matter in Water, Amer Soc Testing Mater 71st Annu Meeting, June 23-28, 1968, San Francisco, pp 116-124, Feb 1969. 9 p, 16 ref. NSF Grant GB6422X USPHS WP 01188-01.

Descriptors: *Analytical techniques, *Chemical analysis, *Molybdenum, *Nutrients, Trace elements, Chemical precipitation, Organic compounds, Spectrophotometry.
Identifiers: Micronutrients, Trace metals, Coprecipitation.

Molybdenum is determined directly in solutions containing above 100 ppb. A spectrophotometric method using the extractable complex with diacetyldithiol was found to be the most convenient and the least subject to interference of a number of methods. Preconcentration of dissolved molybdenum by coprecipitation with hydrated manganese dioxide followed by spectrophotometry of the dithiol complex allows the determination of 1 microgram of molybdenum in a 5-liter sample (o.2ppb) with a relative error of 3%. Particulate matter may be removed from water samples by HA Millipore filtration or by continuous flow (150 ml/min) centrifugation at 28,000 g. The latter method is more convenient for processing the large (10L to 50L) water samples needed for estimating the trace metal content of suspended particles in unpolluted waters. Molybdenum is most conveniently released from organic materials by wet oxidation with perchloric acid, the residue being taken up in 3-N hydrochloric acid. Hydrofluoric acid digests of silicate samples were found to give higher recoveries than perchloric acid digests and were found to be more reproducible than fusion methods. Clayton McAuliffe.
Proc of Symp on Geochem of Subsurface Brines, Kansas Univ, Mar 25-26, 1968. Chem Geol, Vol 4, No 1-2, pp 225-233, Mar 1969. 9 p, 4 fig, 3 tab, 11 ref.

Descriptors: *Water chemistry, *Analytical techniques, *Chemical analysis, *Organic compounds, Brines, Saline water systems, Saline water, Solutes, Ions, Alcohols, Aromatic compounds, Chromatography, Solubility, Gas chromatography.
Identifiers: *Hydrocarbons.

Hydrocarbons dissolved in subsurface waters can be determined by several analytical procedures. The method selected should depend upon the hydrocarbons of interest and the sensitivity required. These methods provide techniques that can be used as an aid in petroleum exploration, and provide information to help answer questions concerning petroleum origin, migration, and accumulation. Proper percautions must be taken to minimize hydrocarbon loss during sample collection, storage, and analysis. The solubility of hydrocarbons in water varies as much as 5-6 orders of magnitude, depending upon the hydrocarbon type and molecular weight within a homologous series. The concentration of dissolved hydrocarbons in subsurface brines varies widely from brine to brine. Marked variations also occur in the relative concentrations of the individual hydrocarbons dissolved.

5B. Sources of Pollution

A CHEMICAL INDEX OF SOIL NITROGEN AVAILABILITY,
Iowa State Univ., Ames. Dept. of Agronomy.
D. R. Keeney, and J. M. Bremner.
Nature, Vol 211, No 5051, pp 892-893, Aug 1966. 1 tab, 6 ref.

Descriptors: *Cycling nutrients, Chemical analysis, Eutrophication, Water pollution sources, Soils, Sediments, Nitrogen compounds.
Identifiers: *Soil nitrogen availability, Steam distillation procedure, Kjeldahl procedures.

A chemical method of obtaining an index of soil nitrogen availability is described and compared

LIBRARY U. OF I., URBANA CHAMPAIGN

with three other chemical methods and two biological procedures. The proposed procedure involves extraction of 5 grams of soil with 30 milliliters of boiling water and determination of the extracted nitrogen by a steam distillation procedure. The procedure correlated well with the two incubation procedures and provided a rapid, reliable determination of soil nitrogen availability. (Konrad-Wis)

ENDRIN IN WATER FROM TREATED DOUGLAS FIR SEED,
Federal Water Pollution Control Administration, Corvallis, Oreg. Pacific Northwest Water Lab.
Richard B. Marston, Robert M. Tyo, and Stephen C. Middendorff.
Pesticides Monit J, Vol 2, No 4, pp 167-171, Mar 1969. 5 p, 4 fig, 2 tab, 2 ref.

Descriptors: *Pesticides, *Pesticide kinetics, *Water pollution sources, *Endrin, *Oregon, Pesticide drift, Pesticide residues, Water chemistry, Leaching, Translocation, Path of pollutants, Streamflow.
Identifiers: Alsea River (Oreg), Seed treatment residues.

Reseeding a 175-acre 'clear-cut' watershed in the headwaters of the Alsea River near Salado, Oreg., on January 23, 1967, followed the conventional practice of aerially broadcasting endrin-coated Douglas fir seed. Measurable amounts of endrin were detected in the streamflow for 2 hours after seeding started and again during the high flow of a winter freshet that occurred the sixth day after seeding. The total amount of endrin found in these two periods of runoff amounted to only 0.006 lb per square mile, or 0.12% of the endrin used to treat the seed. This was much lower than the results obtained in the laboratory (11.3%) from soaking endrin-treated seed in distilled water for 32 days.
W69-06947

DISTRIBUTION OF DIELDRIN AND DDT CRANBERRY BOG SOIL,
Massachusetts Univ., East Wareham. Cranberry Experiment Station.
K. H. Deubert and B. M. Zuckerman.
Pesticides Monit J, Vol 2, No 4, pp 172-175, Mar 1969. 4 p, 1 fig, 2 tab, 6 ref. Water Resources Grant WR-10.

Descriptors: *Pesticide residues, *Bogs, *DDT, *Dieldrin, *Path of pollutants, *Pesticide kinetics, Leaching, Translocation, Streamflow, Cranberries, Soil contamination, Water pollution sources, Adsorption, Organic matter, Soils.
Identifiers: Cranberry bogs.

Relatively large amounts of dieldrin, averaging 1.18 ppm and large amounts of DDT residues, averaging 3.57 ppm, 13 years after the last application were found in the top 2 inches of cranberry bog soil. Horizontal movement of the residues is favored by the movement of floodwater. In view of the possibility that dieldrin residues in cranberry bogs may contribute to water pollution, a leaching experiment was carried out. Chromatographic columns were filled with washed Standard Sand 20-30 until a 1-inch layer was obtained. A 2-inch layer of 2-mm air dry bog soil containing 2.3 ppm dieldrin was added and covered with 1 inch of sand. Distilled water was added at a rate of 2 ml/min, and the first 250 ml of eluate was analyzed for dieldrin. The eluate was not analyzed for organic colloids as carriers of dieldrin, although there are indication that dieldrin is bound to organic colloids by physical forces. The 250 ml of water removed 0.19 of the 42.5 micrograms of dieldrin contained in the bog soil. Under natural conditions water that is drawn off a bog has come in contact with the soil surface only. On the bog the residues may move with the floodwater, as the distribution of DDT in Bog 1 and the dieldrin residues in the irrigation ditches of Bog 2 indicate. Sprinkler irrigation instead of flooding appears to be a promising measure to keep the horizontal movement of these and probably other residues at a minimum.

GROUND-WATER POLLUTION FROM NATURAL GAS AND OIL PRODUCTION IN NEW YORK,
Geological Survey, Albany, N. Y.
Leslie J. Crain.
N Y State Water Resources Comm Rep of Invest No RI-5, 1969. 15 p, 8 fig, 10 ref.

Descriptors: *Water pollution, *Oil fields, *Groundwater, *New York, Oil wastes, Oily water, Saline water, Water wells, Aquifers.
Identifiers: Groundwater pollution (N Y).

Natural gas is produced throughout the central and western part of New York, whereas oil production has been limited mainly to Alleghany and Cattaraugus Counties. Ground-water pollution resulting from leakage of natural gas wells is in the form of salt water or gas. Such pollution is usually very local and is usually difficult to separate from natural contamination. Oil production, particularly the secondary recovery of oil by the water-flooding method, has resulted in the pollution of ground- and surface-water supplies with oil and salt water. Pollution from active oil fields has been caused by separator units that dispose their wastes on the ground, and by leakage and spillage from wells. Pollution in abandoned fields is usually caused by the upward movement of oil and salt water, under artesian pressure, through uncapped or leaking wells. The problems of oil pollution are expected to increase in the future as other areas in the oil fields become populated or are developed for sources of water supply. Pollution from abandoned fields especially is expected to increase. (USGS)

IMPORTANCE OF THE BOD PLATEAU,
California Univ., Davis.
E. D. Schroeder.
Water Res, Vol 2 No 11, pp 803-809, Nov 1968. 7 p, 2 fig, 4 tab, 17 ref.

Descriptors: *Biochemical oxygen demand, *Laboratory tests, Biochemistry, Bacteria, Biodegradation, Sludge digestion, Aquatic microbiology, Dissolved oxygen, Indicators, Organic matter, Oxygen sag.
Identifiers: Substrate removal (Bacterial).

Laboratory experiments show that 5-day BOD, 24-hr BOD, or any other timed determination is not reproducible or significant, but that BOD reaches reproducible plateau values if allowed to react long enough. Oxygen demand is not a function of time in the strict sense, but the plateau value is formed when bacteria remove the substrate, and occurs at any time depending on the number and physiological state of the initial bacteria content. AN ECOLOGICAL STUDY OF THE ALGAE OF THE RIVER MOOSI, HYDERABAD (INDIA) WITH SPECIAL REFERENCE TO WATER POLLUTION - 1. PHYSICO-CHEMICAL COMPLEXES,
Osmania Univ., Hyderabad, (India). Dept. of Botany.
V. Venkateswarlu.
Hydrobiologia, Vol 33, No 1, pp 117-143, Mar 1969. 26 p, 18 fig, 2 tab, 55 ref.

Descriptors: *Ecology, *Algae, *Rivers, *Water pollution, *Water pollution sources, Irrigation, Aquatic algae, Water analysis, Carbonates, Nitrates, Chlorides, Ammonium compounds, Oxygen, Silicates, Organic matter, Air temperature, Aerobic bacteria, Water temperature, Iron.
Identifiers: *India, Moosi River ecological study.

This investigation is concerned with the ecology of the River Moosi, Hyderabad (India) using the data extended over a period of two years with the collection of monthly samples. It deals mainly with the physico-chemical complexes present in the unpolluted and polluted waters of the river. The interrelationships and fluctuations existing between the following factors have been investigated: (1) chloride and water current; (2) nitrate, dissolved oxygen, and free ammonia; (3) nitrate and albuminoid ammonia; (4) free ammonia and albuminoid ammonia; (5) dissolved oxygen, oxidizable organic

matter, and water temperature; and (6) total iron and pH. (Gabriel-USGS)

TRANSPORT OF CHROMIUM-51 IN AN ORGANICALLY POLLUTED ENVIRONMENT,
Tulane Univ., New Orleans, La. Dept. of Civil Engineering; and Texas Univ., Austin. Dept. of Civil Engineering.
Larry W. Canter, and Earnest F. Gloyna.
See also W69-07110. Proc 23rd Ind Waste Conf, May 7-9, 1968, Purdue Univ, Part 1, pp 374-387, 1969. 14 p, 9 fig, 3 tab, 11 ref. AT (11-1)-490.

Descriptors: *Path of pollutants, *Radioisotopes, *Chromium, Oxidation, Reduction, Organic matter, Water pollution, Oxidation-reduction potential, Water chemistry.
Identifiers: Chromium radioisotopes.

Laboratory flume studies of the transport of Cr-51 in streams with organic pollution showed that Cr in non-polluted river tends to exist in the hexavalent state regardless of its initial oxidation state. These findings support the observed predominance of Cr in the hexavalent oxidation state throughout the 240-mile length of the Columbia River below the Hanford reactors. Cr in organically-polluted river systems tends to exist in the trivalent state regardless of its initial oxidation state.

LEACHING OF FERTILIZER IONS IN SOIL COLUMNS,
Western Australia Univ., Nedlands. Dept. of Soil Science and Plant Nutrition.
L. A. G. Aylmore, and Mesbahul Karim.
Trans of 9th Int Congr of Soil Sci, Adelaide, Australia, Vol 1 of 4 vol, pp 143-153, 1968. 11 p, 6 fig, 17 ref.

Descriptors: *Soil water movement, *Leaching, *Fertilizers, *Ion transport, *Ion exchange, Diffusion, Dispersion, Solutes, Nutrients, Chlorides, Clays, Sulfates, Lysimeters, Phosphates.
Identifiers: Fertilizer leaching.

The movement of non-reactive and of reactive ions through columns containing artificial soils has been studied and the results compared with the distributions predicted by the chromatographic theories of Day, Lapidus and Amundson, Glueckauf, and Hiester and Vermeulen for the particular conditions of the experiments. Evidence has been obtained that the spreading of a solution-solvent boundary through longitudinal molecular diffusion is only of significance at flow rates of the order of 1 cm/hr or less. The holdback of non-adsorbed ions by diffusion into intra-aggregate pores at slow flow velocities has been illustrated. Comparatively good agreement between experimental and theoretical distributions was obtained under these controlled conditions for both non-reactive and reactive species. The results, however, illustrate the dependence of the progressive adsortion-desorption process by which the movement of a particular ionic species occurs on the presence of other ions, pH value and the complicities of soil constitution. These factors make a generalized theoretical approach to the movement of ions in solution through soils extremely difficult.
W69-07137

TRANSPORT OF ATRAZINE IN A LATOSOLIC SOIL IN RELATION TO ADSORPTION, DEGRADATION, AND SOIL WATER VARIABLES,
Hawaii Univ., Honolulu. Dept. of Agronomy and Soil Science.
R. E. Green, V. K. Yamane, and S. R. Obien.
Trans of 9th Int Congr of Soil Sci, Adelaide, Australia, Vol 1 of 4 vol, pp 195-204, 1968. 10 p, 3 fig, 7 ref.

Descriptors: *Pesticide kinetics, *Diffusion, *Path of pollutants, *Soil water movement, Adsorption, Hydrolysis, Biodegradation, Leaching, Chromatography, Dispersion, Permeameters, Hydraulic models, Mathematical models.
Identifiers: Pesticide transport, Latosols, Atrazine.

Atrazine transport in a latosolic soil was measured in the laboratory under saturated and unsaturated conditions. Effluent peaks for unsaturated columns were higher and arrived somewhat later than under saturated conditions. Atrazine elution from saturated columns was found to be nearly the same at flow velocities of 0.6, 3.5, and 7.0 cm/hour. A simple chromatographic model assuming a constant distribution coefficient, instantaneous and reversible adsorption, and laminar fluid flow was used to examine the extent to which adsorption alone would explain the transport of adsorbed molecules. The experimental elution curve arrived earlier and had much greater spread than predicted by the model. Important factors which were not accounted for by the model are variation in microscopic flow velocities and non-linearity of the adsorption isotherm. Chemical hydrolysis of atrazine and the higher adsorption of hydroxy-atrazine at some concentrations suggest that degradation is an important factor affecting atrazine mobility in the field. In conclusion, atrazine transport was closely related to the cumulative infiltration with little sensitivity to flow rate or prevailing water content. A chromatographic approach to the study of pesticide transport appears promising, but consideration must be given to both adsorption and dispersion factors.

KINETICS OF CONTINUOUS CULTIVATION,
Takeda Chemical Industries Ltd., Osaka (Japan). Microbiological Research Labs.
Takehiko Kono, and Tsunetomo Asai.
Biotechnology and Bioengineering, Vol XI, Issue 1, pp 19-36, 1969. 10 fig, 4 tab, 5 ref.

Descriptors: *Kinetics, *Equations, Bioassay, Growth rates, Microorganisms, Mathematical studies, Theoretical analysis.
Identifiers: *Kinetic theory, *Continuous cultivation, Microbial growth, Population dynamics, Chemostats, Critical concentration, Coefficient of consumptive activity, Mutant populations.

The kinetics of continuous cultivation are developed by applying the theory of microbial cell growth presented previously by the authors. The theory is based on the concepts of critical cell concentration and a coefficient of consumptive activity. The kinetics of both single-stage and multistage reactors are developed and equations describing changes in cell concentration during the different phases of growth are given. Productivity of cell mass is defined and it is shown that productivity decreases as the number of stages of multistage reactors increases. Population characteristics of contaminants and mutants in continuous cultivation are considered by assuming that growth rate is proportional to that of the original cells. (Uttormark-Wis)

CONTINUOUS CULTURE OF TORULOPSIS UTILIS WITH OXYGEN THE LIMITING NUTRIENT,
Wisconsin Univ., Madison. Dept. of Biochemistry.
Don Kuhner Button.
PhD Thesis, Wisconsin Univ, 1964. 57 p, 12 fig, 7 tab, 21 ref, 3 append.

Descriptors: *Yeasts, *Oxygen, Microbiology, Growth rates, Model studies, Kinetics, Water pollution effects, Eutrophication.
Identifiers: *Continuous culture, *Torulopsis utilis, *Limiting nutrients, Chemostats, Michaelis-Menton equation, Saturation constants, Growth kinetics, Microbial nutrition.

The yeast, Torulopsis utilis, was grown in continuous culture to determine the effect of low oxygen

LIBRARY U. OF I., URBANA CHAMPAIGN

on growth rate. The Michaelis-Menton equation which relates growth rate to limiting nutrient concentration was used as a basis for analysis. The maximum growth rate was found to be 0.506/hours, and the saturation constant (oxygen concentration which produces growth at one-half the maximum rate) was determined to be 0.000014 Molar. The assumptions on which the theory of continuous culture is based were examined and for the conditions of this study it was concluded that: (1) the Michaelis-Menton equation provides a reasonable description of growth rate as a function of oxygen concentration; (2) steady-state did exist in the reactor and could be approached from both directions; (3) nearly all cells produced were viable thus growth rate was determined solely by the hydraulic residence time of the reactor; and (4) mixing in the reactor was sufficiently complete to allow steady-state conditions to become established. Descriptors: *Nitrogen compounds, *Nutrients, *Algae, *Microorganisms, Biodegradation, Nitrification, Denitrification, Organic compounds, Ammonia, Nitrites, Nitrates, Yeasts, Bacteria, Aquatic bacteria, Water pollution effects.
Identifiers: Nitrogen assimilation.

A study of biological nitrogen removal utilized 2 recirculating laboratory streams. The sole nitrogen source in 1 stream was calcium nitrate and in the other was yeast extract. Nitrite and nitrate increased slightly. Bacteria and combined nitrogen decreased rapidly after the initial rise. In the stream with the inorganic nitrogen medium, about half of the nitrate disappeared in 2 weeks, and nitrate was undetectable after the 3rd week. Bacterial counts were relatively low and constant. Periphyton increased in both streams as nutrients decreased, reaching quasi-steady states after about 4 weeks. The rate of biomass increase was greater in the inorganic medium. Nitrate was directly assimilated by algae. Organic nitrogen was converted to ammonia by proteolytic bacteria. Ammonia from organic compounds was partly assimilated by algae and partly nitrified by bacteria. Nitrate of bacterial origin was assimilated by algae. Nitrification apparently was not of major importance in converting organic nitrogen to algal biomass. Laboratory streams simulate natural streams in diurnal cycles of pH and dissolved oxygen, in periphyton growth rate and biomass, and in assimilation of nutrients. Use of model systems to study natural processes under controlled conditions appears justified. (Knapp-USGS)

EUTROPHICATION – CAUSES AND EFFECTS,
Michigan Univ., Ann Arbor. Dept. of Sanitary and Water Resources Engineering.
J. A. Borchardt.
J Amer Water Works Ass, Vol 61, No 6, pp 272-275, June 1969. 4 p, 2 fig, 1 tab, 1 photo, 4 ref.

Descriptors: *Eutrophication, *Water pollution sources, *Lakes, Nutrients, Fertilizers, Phosphates, Nitrates, Algae, Great Lakes.
Identifiers: Eutrophication prevention, Ecologic imbalances.

The causes and effects of accelerated eutrophication of lakes and streams are outlined. The important natural factors involved are geology, lake basin geometry and size, type and size of watershed, and latitude. The most important single variable is man's treatment of the lake. Accelerated eutrophication is a result of accelerated addition of phosphorus and nitrogen nutrients, nearly always caused by some form of human activity. Fertilizers, municipal wastes, industrial wastes, and recreational wastes are the most common nutrient sources. The most visible and obnoxious result of eutrophication is algae growth. Correction of eutrophic conditions is almost impossible. Prevention is necessary to avoid the problem in the future. (Knapp-USGS)

ADSORPTION IN MULTICOMPONENT SOLUTION BY ACTIVATED CARBON,
Rhode Island Univ., Kingston. Dept. of Civil Engineering; and Rutgers - The State Univ., New Brunswick, N. J.
Calvin P. C. Poon, and Maw-hao Sung.
Water Resources Bull, Vol 5, No 1, pp 39-46, Mar 1969. 8 p, 3 fig, 3 tab, 7 ref.

Descriptors: *Tertiary treatment, *Activated carbon, *Adsorption, Nutrients, Organic compounds, Detergents, Sewage treatment.
Identifiers: Avtivated carbon regeneration.

It was found that the total adsorptive capacity of activated carbon was enhanced by using a multicomponent solution with glucose, peptone and phenylphosphonic acid. The removal of glucose was increased in the presence of phenylphosphonic acid. A maximum use of the carbon adsorptive capacity is possible if the carbon is used for tertiary treatment followed by treating a stronger waste.

THE COST OF CLEAN WATER AND ITS ECONOMIC IMPACT.
Federal Water Pollution Control Administration, Washington, D. C.

Fed Water Pollut Contr Admin Rep on Clean Waters, Vol 1, Jan 1969. 220 p, 15 fig, 53 tab, 22 ref.

Descriptors: *Water pollution control, *Sewage treatment, *Water quality act, *Economic impact, Costs, Municipal wastes, Industrial wastes, Farm wastes, Acid mine water, Water quality, Water quality control, Legislation, Waste disposal, Tertiary treatment, Water management (Applied).
Identifiers: *FWPCA.

National requirements and costs of water pollution control are summarized and national clean water goals are outlined. Over 90% of the Nation's sewered population is also served by waste treatment plants, and 60% with secondary treatment. Prevalence of treatment is greatest west of the Mississippi. Most of the untreated discharge is in New England, New York, and Pennsylvania. Generally, industrial waste-handling improvement investment is at about the level recommended by FWPCA, but municipalities are spending half that amount. The problems and recommendations made for improvement of present treatment and addition of new facilities are discussed in detail. (Knapp-USGS)

ION EXCHANGE TREATMENT OF ACID MINE DRAINAGE,
Bethlehem Steel Corp., Pa. Homer Research Labs.; and Bethlehem Steel Corp., Pa. Engineering Dept.
J. J. Sterner, and H. A. Conahan.
Proc of 23rd Ind Waste Conf, May 7-9, 1968, Purdue Univ, Part 1, pp 101-110, 1969. 10 p, 3 fig, 3 tab, 1 ref.

Descriptors: *Water pollution control, *Waste water treatment, *Acid mine water, *Ion exchange, Neutralization, Limes, Mine acids, Iron, Sulfates.
Identifiers: Acid mine water treatment, Acid mine drainage.

A pilot plant using ion exchange to reduce pH, sulfate, and iron concentrations in acid mine drainage demonstrates that 15% aqueous sodium chloride solution is feasible regenerant for an ion exchange treatment in a process to produce effluent complying with the discharge standards of the Pennsylvania Sanitary Water Board. The cations, including dissolved iron, are concentrated into a waste stream which is only 1.7% of the volume of the original contaminated stream. The slight residual acidity of the product water is eliminated by treatment with lime. Larger amounts of lime are required to neutralize the waste stream, and this should be done at about 180 F. The neutralized waste stream can be settled to a sludge containing 10.5% solids or can be dewatered by filtering at 180-190 F to a cake containing 25% solids. Costs were $0.166 for NaCl, $0.109 for Ca0, and $0.019 for heating per 1000 gals of acid mine water. The quantity of lime required for neutralizing both the waste stream and the residual acidity of the processes stream would be the same as the quantity required for straight lime neutralization of the raw water, approximately 10.9 lbs Ca0 per 1000 gals of acid mine water.
W69-07112

WATER REUSE AT THE CELULOSA Y DERIVADOS, S. A. PLANTS,
Celulosa y Derivados S.A., Monterrey (Mexico). Copropiedad Grupo Quimico.
Hector J. Gomez.
Proc of 23rd Ind Waste Conf, May 7-9, 1968, Purdue Univ, Part 1, pp 165-169. 5 p, 2 tab.

Descriptors: *Water reuse, *Sewage treatment, *Waste water treatment, Activated sludge, Filtration, Ion exchange, Industrial water, Water supply, Municipal wastes.
Identifiers: *Monterrey (Mexico), Celelosa y Derivados.

Reuse of municipal waste water for industrial production in Monterrey, Mexico is described. About 60% of the city's water is reused by over 30 industries. Celulosa y Derivados was the first to purify domestic wastes. Raw sewage is sent to the treatment plant in a 10 mi long 24 in line. The first treatment is by an activated sludge process with a 2.2 mgd capacity. The chlorinated effluent is used for irrigation, fire protection, cooling, and input for tertiary treatment. Water for industrial process uses is clarified, softened and filtered. High-purity water is demineralized by ion exchange. Chemical analyses of waters in various treatment stages are tabulated. The activated sludge treatment costs $.07 per 1,000 gal, lime-aluminate filtration adds a cost of $0.18, and ion exchange adds $0.40. (Knapp-USGS)
W69-07113

SPRAY IRRIGATION OF ORGANIC CHEMICAL WASTES,
Commercial Solvents Corp., Terre Haute, Ind.
Richard A. Woodley.
Proc of 23rd Ind Waste Conf, May 7-9, 1968, Purdue Univ, Part 1, pp 251-261, 1969. 11 p, 1 fig, 3 tab.

Descriptors: *Waste water disposal, *Irrigation, *Chemical wastes, Sprinkler irrigation, Infiltration, Groundwater, Water levels, Water quality, Biochemical oxygen demand, Suspended load.
Identifiers: Organic chemical wastes.

At the Terre Haute, Indiana plant of Commercial Solvents Corporation, a spray irrigation system has been successfully utilized since August 1965 for treatment of high strength, low volume waste from aerobic industrial fermentation processes. Wastes varying in BOD up to 64,700 mg/1, suspended solids up to 99,700 mg/1, and flows up to 160,000 gpd have been routinely sprayed on 100 one-acre plots without causing any environmental nuisances or any community problems whatsoever. The land application system has been managed so that total treatment of all applied wastes has been achieved. Land and system management has consisted of spray plot selection, application time control, elimination of surface runoff, and control of surface ponding. Continuous wintertime operation has been achieved by pre-planning for minus zero C operations and the installation of rapid draining spray headers and laterals. Equipment subject to 24 hr contaminant of liquid is protected by various types of electrical heaters.
W69-07114

FOAM SEPARATION BEHAVIOR OF AQUEOUS SUSPENSIONS OF CLAYS AND/OR IRON,
Marquette Univ., Milwaukee, Wis. Dept. of Civil Engineering; and Kentucky Univ., Lexington. Dept. of Chemical Engineering.
C. J. Crandall, and R. B. Grieves.
Water Res, Vol 2, No 12, pp 817-832, Dec 1968. 16 p, 6 fig, 4 tab, 17 ref.

Descriptors: *Clays, *Iron, *Iron compounds, *Flotation, *Foam separation, Foaming, Surfactants, Surface tension, Water pollution treatment, Water treatment, Water purification, Foam fractionation, Sewage treatment, Tertiary treatment.
Identifiers: Foam flotation, Clarification.

To establish the relative efficiencies of foam separation of kaolinites, illites, and montmorillonites and to produce a further understanding of phenomena occurring at clay-water-air interfaces, and extensive experimental investigation is conducted. The study includes the effect that each of 6 clays has on the foam separation of iron, both divalent and trivalent, and any influence that iron may provide to the flotation of the clays. The effects are established on clay flotation, on iron flotation, on surfactant flotation, and on foamability, of clay type, of pH, and of the presence and form (determined by pH) of iron. A cationic surfactant, ethylhexadecyldimethylammonium bromide, is employed as the foam separation agent over the pH range 2.5-11.5. In general, the montmorillonites exhibit exceptional behavior due to their large specific surface and high exchange capacity. Results are interpreted in terms of a basic model involving the interaction of clay particles, surfactant cations, and soluble and/or particulate iron.

THE BACTERIAL DEGRADATION OF SYNTHETIC ANIONIC DETERGENTS,
Upper Tame Main Drainage Authority, Birmingham (England). Biological Lab.
Roaslynd Cook.
Water Res, Vol 2, No 12, pp 849-876, Dec 1968. 28 p, 15 fig, 11 tab, 13 ref.

Descriptors: *Biodegradation, *Detergents, *Surfactants, *Alkylbenzene sulfonates, Linear alkylate sulfonates, Water pollution treatment, Sewage treatment, Tertiary treatment, Aerobic bacteria.
Identifiers: Household detergent degradation, Slope culture.

Biodegradability of synthetic anionic detergents was studied using the slope culture technique. Solutions of the detergents known as JNX, JNQ, sodium tetrapropylene benzene sulphonate, a 'difficult' alkyl benzene sulphonate and Dobane 055 were inoculated with bacteria from various sewage works effluents which had undergone prior acclimatization to a particular detergent on an agar slope; unacclimatized bacteria were also investigated. Further tests were carried out using a single, standard effluent and a microbial slime from an experimental recirculating filter together with a more stringent testing procedure. The results of all tests showed that the detergents had a low biodegradability value and they were inconsistent. Bacteria which degraded JNX were isolated from a sewage works effluent and from the microbial slime which developed on an an experimental recirculating filter matured on JNX. Inoculation of the bacteria into a detergent solution was found to be ineffective in assessing their detergent degrading ability. A recirculating filter was developed for this purpose and proved to be successful. The active bacteria were members of the genera Klevsiella, Achromobacter, Flavobacterium, and Micrococcus. Degradation occurred in the presence of inert materials such as gravel, asbestos, or dried activated sludge provided that the detergent solution was vigorously agitated. The presence of an additional nutrient such as peptone did not appear to interfere with the normal degradation of the detergent. Attempts were made to induce the bacteria E. coli and Serratia marcescens to degrade JNX in a recirculating filter; these attempts were unsuccessful.

5E. Ultimate Disposal of Wastes

UNDERGROUND WASTE DISPOSAL,
Bradley Oil Corp., Tulsa, Okla.
J. L. Wright.
Ind Water Eng, Vol 6, No 5, pp 24-27, May 1969. 4 p, 8 fig, 4 tab, 5 ref.

Descriptors: *Waste disposal, *Industrial wastes, *Injection wells, Aquifers, Water quality, Legal aspects, Porosity, Permeability, Costs, Economics.
Identifiers: Deep-well waste disposal.

Deep-well disposal of industrial wastes is recommended for areas where laws and geological formations are favorable. The geology of several areas with favorable geologic conditions is discussed and estimated costs of injection and surface disposal are tabulated. (Knapp-USGS)
W69-06943

DIFFUSER DESIGN FOR DISCHARGE TO A STRATIFIED WATER,
Danish Isotope Center, Copenhagen.
Poul Harremoes.
Water Res, Vol 2, No 11, pp 737-752, Nov 1968. 16 p, 12 fig, 20 ref.

Descriptors: *Sewage disposal, *Outlets, *Coasts, *Density stratification, Currents (Water), Diffusion, Water pollution control, Flow, Ocean currents.
Identifiers: *Denmark, *Sweden, Diffusers, Outfall design.

Results from several tracer experiments with submerged sewage fields in long-shore currents having pronounced stratification are used as a basis for the economical optimization of a discharge of domestic sewage through a diffuser. Existing theories on jet

LIBRARY U. OF I., URBANA CHAMPAIGN

diffusion have been modified to fit the observed conditions, which have almost arbitrarily varying density distributions. A first approximation to dispersion in stratified flow is applied with data derived from tracer experiments. Bacterial decay is disregarded due to the very slow decay rates previously observed in The Sound, which is the strait between Denmark and Sweden. The computation of fet diffusion and stratified dispersion is computerized to meet the demand for a statistical prediction of pollution and for selecting the most economical design among the infinite number of possible outfall designs. Density effects on the sewage field are suggested to be of significance to design criteria for diffusers.

DEEP WELL INJECTION OF INDUSTRIAL WASTES,
Hydro-Development, Inc., Bakersfield, Calif.
John C. Manning.
See also W69-07110. Proc of 23rd Ind Waste Conf, May 7-9, 1968, Purdue Univ, Part 2, pp 655-666, 1969. 12 p, 7 fig.

Descriptors: *Injection wells, *Waste disposal, *Industrial wastes, Aquifers, Groundwater movement, Waste water disposal, Water quality, Waste water treatment, Water levels, Permeability, Porosity.
Identifiers: Waste water injection.

When water is injected into a confined subsurface formation, the pressure in the formation is increased, and the formation tends to dilate. There is ample space in the subsurface reservoir for injection of large quantities of fluid so long as an areally extensive injection formation is available. Almost any area underlain by sedimentary rocks could have potential disposal reservoirs. Igneous or metamorphic rocks might have favorably situated subsurface zones, but generally these will not be as favorable as will the sedimentary rocks. Any waste fluid that is free of particulate matter and that, after reasonable treatment, will not cause undesirable reactions with the solid matrix of the disposal formation or its original fluid should be suitable for injection disposal. However, injection disposal is expensive and is best suited for relatively small quantities of particularly noxious wastes. All types of water desalination schemes have the problem of concentrated brine disposal, and where there is no convenient ocean, an injection well might provide a safe and convenient disposal.

CULTURAL EUTROPHICATION IS REVERSIBLE,
Wisconsin Univ., Madison. Lab. of Limnology.
Arthur D. Hasler.
BioScience, Vol 19, No 5, pp 425-431, May 1969. 3 fig, 1 tab, 7 ref.

Descriptors: *Eutrophication, *Fertilization, *Limnology, *Phytoplankton, Fish, Great Lakes, Legislation, Nitrogen, Nuisance algae, Phosphorus, Washington, Wisconsin, California.
Identifiers: *Cultural eutrophication, Lake Monona (Wis), Lake Tahoe (Calif), Lake Washington (Wash), Zurichsee (Switzerland).

Various human activities contribute to excessive enrichment (cultural eutrophication) of waters. Among the symptoms of cultural eutrophication are nuisance blooms of algae, increased nutrient levels, depletion of hypolimnetic oxygen, increased turbidity, and changes in the species-compositions of phytoplankton, invertebrates, and fishes. A case history is presented (Zurichsee) documenting changes in limnological conditions, as well as additional relevant data from North American lakes. As methods of solving the problems of cultural eutrophication, author suggests that more extensive dissemination of information, involvement of all citizens and citizen groups in workshops and seminars, and enlightened legislation. The Wisconsin Resources Law (1965) is given as an example of legislation and the philosophy of zoning is discussed. Three examples are given (Lakes Monona, Tahoe, Washington) where success is curbing cultural eutrophication has been achieved. Methods of control and harvesting aquatic plants and fish are discussed; also chemical control and sewage utilization. Table gives estimates of nitrogen and phosphorus input to Wisconsin surface waters. See also W68-00680. (Voigtlander-Wis)

STREAM STANDARDS AND WATER SUPPLIES,
Howard D. Zeller.
J Amer Waterworks Ass'n, Vol 61, No 3, pp 131-132, Mar 1969. 2 p.

Descriptors: *Water quality act, *Pollution abatement, *Regulation, *Long-term planning, Water pollution control, Water pollution effects, Water pollution sources, Water resources development, Water purification, Water quality control, Federal government, State governments, Legal aspects, Legislation, Planning.
Identifiers: *Clean Water Restoration Act.

The role of the federal government in the field of water pollution abatement is stated in the Water Quality Act of 1965 and the Clean Water Restoration Act of 1966. These acts establish a framework for the development of water quality standards by the states in cooperation with the federal government. The development of stream standards (including minimum water quality criteria and stream classification) and of plans for abatement of existing pollution are the basic objectives of the program. Stream standards provide the elements for long-range planning in the broad field of water resource management. The development of water quality criteria through the subcommittees named under the acts (National Technical Advisory Committee, NTAC) is a significant new development in the water pollution control field. Federal publication of the NTAC report and acceptance of all the state water quality criteria therein contained are the first steps in the development of a strong national program designed to enhance the quality of the nation's water resources. MICROBES AND MICROORGANICS IN WATER - A REVIEW,
Koppers Co., Inc., Monroeville, Pa. Dept. of Research.
G. R. Tallon.
ASTM STP No 448, Symp on Microorganic Matter in Water, Amer Soc Testing Mater 71st Annu Metting, June 23-28, 1968, San Francisco, pp 3-10, Feb 1969. 8 p, 17 ref.

Descriptors: *Biodegradation, *Organic matter, *Organic compounds, Industrial wastes, Water reuse, Biochemistry, Anaerobic bacteria, Aquatic microbiology, Sewage treatment, Water pollution treatment.
Identifiers: Non-degradable organic wastes.

Biological degradation in a stream is a highly complex, 'assembly-line' process. Most water-borne organics are consumed by microbes, but some substances may persist for long periods. Sources of refractory compounds may be industrial wastes, sewage plant discharges, land drainage, and even metabolic residues from microbial degradation of pollutants. Separation and identification of trace organics is an extremely difficult process requiring the most refined and sophisticated analytical methods. Increasing reuse of surface waters will require more surveillance and new approaches in water management. (For main entry see W69-06968.)

OPTIMAL RELEASE SEQUENCES FOR WATER QUALITY CONTROL IN MULTIPLE-RESERVOIR SYSTEMS,
Michigan Univ., Ann Arbor.
Norbert Antone Jaworski.
Fed Water Pollut Contr Admin, Chesapeake Bay-Susquehanna River Basin Proj Tech Pap No 13, 1968. 231 p, 34 fig, 20 tab, 90 ref, 5 append. PhD dissertation - Michigan Univ.

Descriptors: *Water quality control, *Flow augmentation, *Reservoir operation, *Mathematical models, Computer models, Digital computers, Computer programs, Optimization, Dynamic programming, Operations research, Systems analysis, Simulation analysis, Synthetic hydrology.
Identifiers: *Potomac River Basin.

A method for determining optimal flow release sequences from multiple reservoir systems for water quality control was developed and field tested. The problem was organized as a converging

branch multistage dynamic programming decision system with 5 options for determining optimal release sequences at a decision point. These are: (1) minimum DO deficit for given BOD; (2) minimum DO deficit; (3) least cost of storage for given BOD; (4) least cost of storage; and (5) minimum BOD. A mathematical model of a river system including tributaries and impoundments was developed to simulate the river basin in the decision process. The Potomac River basin was used as a basis for the model and for field checks. Digital computer flow charts and program listings are included for the stream model and the release model. Data needs and costs are discussed and recommendations are made for data collection and analysis schemes for use in attaining optimal control of water quality in multiple reservoir systems. COMPUTER-PRODUCED TABLES, MAPS, AND DIAGRAMS AS TOOLS IN THE INTERPRETATION OF BRINE DATA FROM SOUTHEASTERN KANSAS,
Geological Survey, Washington, D. C.
Jesse M. McNellis, Charles O. Morgan, and Brent H. Lowell.
Proc of Symp on Geochem of Subsurface Brines, Kansas Univ, Mar 25-26, 1968. Chem Geol, Vol 4, No 1-2, pp 303-324, Mar 1969. 22 p, 11 fig, 2 tab, 8 ref.

Descriptors: *Water chemistry, *Brines, *Data processing, *Digital computers, *Kansas, Computer programs, Data collections, Maps, Water qualtiy, Ions.
Identifiers: *Piper diagrams, Stiff diagrams, Tabulation, Automatic data plotting.

The applicability of computer-oriented techniques to assist in the interpretation of brine data is demonstrated by the use of 6 programs on data from 2 example areas. These programs include a data-tabling routine; routines for producing Stiff, Piper, and Ropes diagrams; programs for calculating ionic ratios; and programs for plotting maps of chemical data. The examples illustrate: (1) the range in water quality and contamination of potable water by brines in Stafford, Pratt, and Barber Counties, and (2) the change in water quality in the Arbuckle Group from southeast to south-central Kansas. (USGS)

CHEMICAL COMPOSITION OF SELECTED KANSAS BRINES AS AN AID TO INTERPRETING CHANGE IN WATER CHEMISTRY WITH DEPTH,
Geological Survey, Lawrence, Kans.; Kansas Univ., Lawrence; and Kansas State Geological Survey, Lawrence.
Robert J. Dingman, and Ernest E. Angino.
Proc of Symp on Geochem of Subsurface Brines, Kansas Univ, Mar 25-26, 1968. Chem Geol, Vol 4, No 1-2, pp 325-339, Mar 1969. 15 p, 10 fig, 1 tab, 17 ref.

Descriptors: *Water chemistry, *Brines, *Oil fields, *Kansas, Saline water systems, Saline water, Solutes, Aqueous solutions, Groundwater, Chemical reactions, Equilibrium, Ions, Ion exchange, Geochemistry, Aquifers, Connate water.
Identifiers: *Anomalous brines.

Chemical analyses of approximately 1,881 samples of water from selected Kansas brines define the variations of water chemistry with depth and aquifer age. The most concentrated brines are found in the Permian rocks which occupy the intermediate section of the geologic column of this area. Salinity decreases below the Permian until the Ordovician (Arbuckle) horizon is reached and then increases until the Precambrian basement rocks are reached. Chemically, the petroleum brines studied in this small area fit the generally accepted pattern of an increase in calcium, sodium and chloride content with increasing salinity. They do not fit the often-predicted trend of increases in the calcium to chloride ratio, calcium content and salinity with depth and geologic age. The calcium to chloride ratio tends to be asymptotic to about 0.2 with increasing chloride content. Sulfate tends to decrease with increasing calcium content. Bicarbonate content is relatively constant with depth. If many of the hypotheses concerning the chemistry of petroleum brines are valid, then the brines studied are anomalous. An alternative lies in accepting the thesis that exceptions to these hypotheses are rapidly becoming the rule and that indeed we still do not have a valid and general hypothesis to explain the origin and chemistry of petroleum brines. Michael A. Mastropietro.
See also W69-07110. Proc of 23rd Ind Waste Conf, May 7-9, 1968, Purdue Univ, Part 2, pp 754-765, 1969. 12 p, 11 fig.

Descriptors: *Reaeration, *Dams, *New York, *Turbulence, *Overflow, Outlet works, Discharge (Water), Streamflow, New York State Barge Canal, Regression analysis.
Identifiers: *Mohawk River (NY).

Methods were developed to calculate stream reaeration where water falls over dams and weirs on the Mohawk River, N.Y. Dissolved oxygen and temperature data were collected above and below all the dams between Rome and the Hudson River. A linear regression analysis was made with saturation below the dam as the dependent variable and saturation above the dam as the independent variable. In the regression for the 15-ft dams with 25 observations, the correlation coefficient was 0.94531 with an F value of 201.60. The equation of best fit was y= 0.391 x+58.4. For 7-ft dams, 40 observations yielded a correlation coefficient of 0.98713, F= 1485.81, and the equation of best fit was y= 0.789 x+22.9. DO profiles of the river are shown graphically. (Knapp-USGS)

See also W69-07110. Proc of 23rd Ind Waste Conf, May 7s9, 1968, Purdue Univ, Part 2, pp 1134-1146, 1969. 13 p, 12 fig, 1 tab, 7 ref.

Descriptors: *Reaeration, *Dams, *Turbulence, *Overflow, Outlet works, Discharge (Water), Streamflow, Waste treatment, Water pollution treatment, Water circulation, Spillways, Dissolved oxygen, Reaeration.
Identifiers: Stream reaeration.

Water falling over dams and subsequent downstream turbulence can aerate water with zero upstream DO, at rates as high as 1.0 lbs oxygen per HP-hr at falls up to 10 ft high. A fall of 17 to 20 ft into relatively shallow water or onto dam aprons will yield near-saturation conditions. Surface aerators in shallow ponds yield transfer efficiencies of about 1-1 1/2 lbs oxygen per HP-hr. Aerator efficiency is affected by recycle patterns of water in close proximity to the aerator containing high DO. Attempts to disturb the flow pattern developed by the surface aerators were partially successful. On/off operation of aerators and the introduction of a flow developer which directed water away from the turbine were investigated. A unidirectional flow pattern or an imbalance in aerator discharge direction incorporated in the design of such aerators for use in similar unrestricted systems warrants further investigation.

QUALITY OF THE ENVIRONMENT: AN ECONOMIC APPROACH TO SOME PROBLEMS IN USING LAND, WATER AND AIR,
Resources for the Future, Inc., Washington, D. C.
Orris C. Herfindahl, and Allen V. Kneese.
Baltimore, Maryland, The Johns Hopkins Press, 1965. 96 p.

Descriptors: *Water pollution, *Air pollution, *Pollution abatement, Oxygen sag, Organic waste, Water quality, Quality control, Pesticides, Transportation, Pesticide residues, Chemical wastes.
Identifiers: *Externalities, *Water quality deterioration costs, Degradable pollutants, Synthetic pollutants, Persistent pollutants, Primary pollutants.

The problem in the water resource area, and the natural resource area as a whole, is not one of exhaustion but rather a deterioration in the quality of the environment. The authors attempt to apply economic reasoning aimed at the balancing of desires in matters of resource planning compared to the costs of satisfying these desires in varying degrees. Five areas are selected where the actions of certain economic units are seriously affecting the use of the environment by others. These areas are: water pollution; air pollution; the purposeful introduction into the environment of chemical substances such as pesticides, insecticides, etc.; some developments in urban activities, architecture, and the use of urban space; the development of the rural countryside and wild areas. For each problem area the nature of the problem is explained along with the economics of the possible corrective measures suggested. The book concludes with a discussion of future research strategy. (Murphy-Rutgers)

DRY COMMENTS ON WATER,
J. K. Colman.
N Y Co Lawyers Ass'n Bar Bull, Vol 23, No 1, pp 9-14, 1965-1966. 6 p, 32 ref.

Descriptors: *New York, *Riparian rights, *Pollution abatement, *Water supply, Prior appropriation, Land tenure, Natural flow doctrine, Diversion, Relative rights, Cities, Legislation, Judicial decisions, Reasonable use, Beneficial purpose, Water pollution, Municipal water, Water law, Legal Aspects.
Identifiers: *Common law, *Civil law, *Interstate common law, N Y S Temporary Comm'n on Water.

Water shortage is the water problem of the future which is manifested today in New York City. Pollution is a prime contributor to the shortage. State legislation in pollution abatement has not been effective, but federal emphasis may bring needed change. The current shortage is related to the common law riparian doctrine itself. Of the four riparian rights concepts (common law, civil law, prior appropriation, interstate common law), the common law doctrine most obstructs beneficial use of water. The common law confines riparian rights to owners of land adjacent to streams. The rights cannot be extended regardless of need, since that would violate downstream rights in undiminished flow. Prior appropriation promotes beneficial use by allowing diversion of water for beneficial use. Although common law rights are subject to 'reasonable' use by other riparians, the difficulty in predicting what is reasonable discourages investment in beneficial use. An unreasonable appropriation can be very costly to the city. Acts and cases bearing on these problems are cited, and the New York State Temporary Commission on Water is seeking to reconcile present law with future needs. (Harrs-Fla)

FEDERAL-STATE RELATIONSHIPS IN THE ADOPTION OF WATER QUALITY STANDARDS UNDER THE FEDERAL POLLUTION CONTROL ACT,
H. E. Dunkelberger.
Nat Resources Lawyer, Vol 11, No 1, pp 47-61, Jan 1969. 15 p, 33 ref.

Descriptors: *United States, *Water quality act, *Water pollution, Water resources development, Pollution abatement, Water pollution control, Effluents, Discharge (Water), Streams, State governments, Wastes, Waste water disposal, Sewage effluents, Cities, Interstate rivers, Adjudication procedure, Administrative agencies, Regulation, Legal aspects, Legislation, Water quality control.

The Water Quality Act provides for adoption of federal standards of water quality only in the event that existing state standards are found inconsistent with the standards of the Act by the Secretary of the Interior. State standards adopted under the Act must protect the public welfare and serve the purposes of the Act. The Act provides that peculiar local conditions and circumstances be considered in formulating standards. This is a manifestation of Congressional rejection of a national effluent standard that would grant the Secretary arbitrary authority over state standards. Further evidence of restraints placed on the Secretary is that he may formulate state standards only after giving the state six months in which to enact suitable standards. If the state does not act, the Secretary must convene a public hearing in the affected area upon request of the governor. The hearing board may modify the standards promulgated by the Secretary. The author submits that the present practice of the Secretary in requiring a state to include specific provisions in its Water Quality Acts is an attempt to establish a national effluent standard and is beyond the authority of the Secretary. INTERSTATE COMM'N ON THE POTOMAC RIVER BASIN.
W Va Code Ann, secs 29-1c-1 thru 29-1c-5 (1966).

Descriptors: *West Virginia, *Pollution abatement, *Interstate compacts, *River basin comm'ns, Interstate rivers, Legislation, Pennsylvania, District of Columbia, Maryland, Virginia, Programs, Quality control, Sewage treatment, State governments, Federal government, State jurisdiction.
Identifiers: *Potomac River.

A commission of three members is created to act with commissioners appointed from Pennsylvania, Virginia, Maryland, and the District of Columbia together constituting the 'interstate commission on the Potomac River Basin.' A compact among the member states for the control of pollution is set out. The commission shall have power to: (a) collect data pertaining to pollution; (b) cooperate with other groups and agencies to promote uniform pollution laws; (c) disseminate public information in relation to stream pollution; (d) cooperate with other groups and agencies to formulate programs relating to stream pollution; (e) to comment upon plans of other groups and agencies; (f) recommend minimum standards for sewage treatment and establish water quality standards. Neither the governor nor any member of the commission shall consent to the construction of any dam within or without the state which shall flood lands in the state without the express consent of the legislature. (Kahle-Fla)
W69-07213

PERMITS AND POLLUTION CONTROL.

W Va Code Ann sec 20-5A-5 through 20-5A-8 (1966), as amended, (Supp 1968).

Descriptors: *West Virginia, *Permits, *Sewage disposal, *Water pollution control, Administrative agencies, Industrial wastes, Legislation, Municipal wastes, Sewage treatment, Waste disposal, Sanitary engineering, Pollution abatement, Water treatment, Operation and maintenance, Public health.

It is unlawful for any person to effect any substantial change in the character of sewage disposal from any industrial or commercial establishment without first obtaining a permit from the department of natural resources. All permit applications for activities relating to sewage should be submitted to the Division of Sanitary Engineering. The application should include a plan of proposed maintenance and operation. The Director of the Division of Sanitary Engineering shall determine the health aspects and then refuse or grant the permit. If approved, the permit and application should be forwarded to the division of water resources for final approval. After issuance of a permit, the chief, or his representatives, may periodically inspect the facilities to make sure there is no pollution. The chief can compel compliance with the terms and conditions in the permit by revoking or suspending the permit until such terms are complied with. (Stewart-Fla)

DEPARTMENT OF HEALTH.
Minn Stat Ann secs 144.01 to 144.03, 144.11 to 144.145, 144.35 to 144.37 (1946), as amended, (Supp 1968).

Descriptors: *Minnesota, *Supervisory control (Power), *Public health, *Water pollution, Fluoridation, Diseases, Environmental sanitation, Permits, Sewage disposal, Recreation, Safety, Sanitary engineering, Water purification, State governments, Administrative agencies, Regulation, Streams, Wells, Springs, Water pollution control, Legal aspects, Water supply, Legislation.

The Department of Health is continued under the supervision and control of the State Board of Health. The Board may make rules and regulations necessary to carry out its purposes. It shall enforce reasonable regulations for the preservation of the public health, and upon approval of the attorney general and after publication, such regulations have the force of law. The Board may control sewage disposal, water pollution, and the general

sanitation of hotels and resorts by licensing and other means. The Board shall promulgate rules and regulations relating to the fluoridation of public water supplies. The Board shall have charge of all watercourses used for the discharge of sewage or other matter and shall take all appropriate measures to insure that the public health is not endangered therefrom. The Board may order anyone polluting watercourses within the state to desist from such activity. Persons may appeal from any order issued by the Board. (Helwig-Fla)
W69-07228

PASSAIC VALLEY SEWERAGE DISTRICT.
N J Stat Ann secs 58:14-7, 58:14-8, 58:14-9 (1966), as amended, (Supp 1968).

Descriptors: *New Jersey, *Water pollution control, *Sewage, Administrative agencies, Legislation, Jurisdiction, Rivers, Tributaries, Sewers, Water law, Municipal wastes, Cities, Regulation, Water pollution sources, Sewage disposal, Pollution abatement, Odor, Gases, Local governments, Construction, Planning, Legal aspects.
Identifiers: Putrefaction.

The Passaic Valley Sewage commissioners are given the power to enforce provisions prohibiting the discharge of sewage or other polluting matter into the Passaic River between the Great Falls and Newark Bay by instituting the necessary civil actions in superior court. This court is vested with jurisdiction to enforce these provisions. The act also provides that no sewage, waste matter, or other substance which creates odors, gases, or fumes due to the putrefaction of organic matter may be dumped into the Passaic River or its tributaries between the points mentioned above. Whoever violates this provision, with the exception of a municipal corporation, shall be subjected to a penalty of one hundred dollars plus twenty five dollars for each day the condition remains unabated. The governing bodies of the municipalities may request the commissioners to submit plans for the construction of a trunk line or main intercepting sewer to comply with the mandates of this act. TEXAS CO V MONTGOMERY (POLLUTION CONTROL BY STATE AGENCIES).

73 F Supp 527-536 (E D La 1947).

Descriptors: *Louisiana, *Bayous, *Water pollution control, *Administrative agencies, Brine disposal, Well regulations, State governments, Streams, Lakes, Legislation, Judicial decisions, Legal aspects, Wildlife, Oysters, Federal jurisdiction, Water pollution sources, Water pollution treatment, Oil industry, Oil fields, Oil wastes, Coastal marshes, Gulf of Mexico.
Identifiers: Delegation doctrine.

The Texas Company brought a bill in equity to have a state statute creating the Louisiana Stream Control Commission declared void as violative of the Fourteenth Amendment to the Federal Constitution and as violative of certain articles of the Louisiana constitution. The Commission would control waste disposal of an 'unreasonable' nature into the lakes, streams, rivers and coastal waters of the state. Plaintiff contended that the statute was void on its face since the act failed to set forth an ascertainable standard of pollution to guide the Commission in the exercise of the delegated powers. The court recognized the need for a flexible definition of pollution due to varying water conditions and circumstances and refused to invalidate the statute for vagueness. The plaintiff's contention that the act was invalid in that it delegated unlimited authority to the Commission was denied. The court pointed out that only 'unreasonable pollution' could be regulated by the Commission. Finally, the court declared that the provisions in the act requiring a public hearing prior to the issuance of any Commission directive preserving the right to appellate review of Commission orders were sufficient to satisfy the due process requirements of the 14th Amendment to the Federal Constitution. The court declined to pass on possible violations of the state constitution, stating that such issue was not properly before the court for determination. (Katz-Fla)

06. WATER RESOURCES PLANNING

6A. Techniques of Planning

THE DEVELOPMENT OF A MODEL TO EVALUATE HYDROLOGIC RISK IN A WATER RESOURCES SYSTEM,
Battelle Memorial Inst., Richland, Wash., and Texas A and M Univ., College Station.
William L. Bathke, and R. J. Freund.
Water Resources Bull, Vol 5, No 1, pp 53-61, Mar 1969. 9 p, 3 fig, 15 ref.

Descriptors: *Mathematical models, *Risks, *Systems analysis, *Synthetic hydrology, Optimization, Water resources development, Estimating, Streamflow forecasting, Water supply, Cost-benefit analysis, Operations research.
Identifiers: Water resource system risks.

A technique is described for analyzing a water resource system whose inflow is highly variable. The use of this technique requires not only that a mathematical model be developed of the physical, hydrological, and economic characteristics of the water resource system under study, but also that the economic benefits of the system, including full and partial water deliveries for irrigation development, be evaluated. Although developed independently of and simultaneously with the recently advanced concepts known in part as 'operational hydrology,' the technique described in this article includes some significant departures, such as the development of a complex revenue-loss function and water-shortage statistical characteristics for various reservoir sizes.

RULES FOR ORDERING UNCERTAIN PROSPECTS,
Case Western Reserve Univ., Cleveland, Ohio; and Kentucky Univ., Lexington.
Josef Hadar, and William R. Russell.
AER, Vol 59, No 1, pp 25-34, March 1969. 10 p, 8 ref.

Descriptors: *Average, Probability, Risks, Forecasting, Marginal utility.
Identifiers: *Orderability, *Uncertain prospects, *Utility function, *Variance, *Preference, Probability distribution, Quadratic utility function.

In many theoretical as well as practical situations one is frequently confronted with the necessity of making a prediction about a decision maker's preference between given pairs of uncertain alternatives without having any knowledge of the decision maker's utility function. The usual approach to this problem involves comparisons of means and variances of the probability distribution in question. However, rules of comparison involving only two moments are valid only for limited classes of utility functions, or for special distributions. Except for such special cases as the quadratic utility function, the specification of distributions in terms of their moments is not likely to yield strong results, essentially because information about the moments cannot be utilized efficiently for the purpose of ordering uncertain prospects when the utility function is unknown. In this paper the authors propose two rules which are more powerful than the 'moment method.' Under the stronger of these rules, distributions may be ordered according to preference, given any utility function, while under the weaker rule orderability obtains for any utility function which exhibits nonincreasing marginal utility everywhere. Water is often a product containing significant components of uncertainty in both its supply and demand functions, and this article extends the theoretical treatment of the role of uncertainty in utility analysis and has relevance to both water demand and supply analyses. (Loeb-Rutgers)

INTERREGIONAL FEEDBACKS IN INPUT-OUTPUT MODELS: SOME EXPERIMENTAL RESULTS,
Pennsylvania Univ., Philadelphia.
Ronald E. Miller.
Western Economic Journal, Vol 7, No 1, pp 41-50, March 1969. 10 p, 6 tab, 16 ref, 1 append.

Descriptors: *Input-output analysis, Leontief models, Regional analysis.
Identifiers: *Interregional feedback, Error, Interregional linkage, output, Percentage error.

Studies attempting to measure the impact on a particular region of exogenous changes in the demand for products of that region have frequently employed a regional input-output framework. In these models, linkage to the outside is usually expressed in an export column and an import row. More ambitions interregional models attempt to treat two or more regions with equal detail, specifying a complete input output matrix for each; in addition, flows in each direction between regions, by sector, are recorded in interregional matrices. The time, effort, and expense involved in collecting data frequently prohibit construction of an input-output coefficient matrix for a particular region. It is even more difficult to derive trade coefficient matrices between regions. Thus, a complete interregional framework has seldom been operational. Therefore, interregional feedback effects are usually lost in regional analyses. This paper presents the results of investigation into the question: how large are the interregional feedbacks likely to be in typical situations. Specifically, how much error results from ignoring interregional linkages and determining a region's gross outputs with only a single-region, intraregional model. This analysis would be of relevance to water research since significant research has recently been conducted in designing input-output models for water, especially in the Western states. ON THE RELATIONSHIP AMONG DIFFERENT MEMBERS OF THE K-CLASS,
Washington Univ., Seattle.
Walter Y. Oi.
International Economic Review, Vol 10, No 1, pp 36-46, February 1969. 11 p, 13 ref.

Descriptors: Least squares method, Regression analysis, Dispersion.
Identifiers: *K-class method, *Ordinary least squares, *Two-stage least squares, Limited information, Reduced-form residuals, Specification errors, Collinearity.

The K-class can be viewed as a general estimation method which includes ordinary least squares, two-stage least squares, and limited information as particular members. This paper presents an alternative derivation of the K-class method in which least squares is applied to a structural equation after suitable transformations have been applied to the jointly dependent variables. Different members of the k-class (differing in their posited values of K) correspond to different transformations of measured reduced-form residuals. The relationships among parameter estimates of different K-class members are then revealed by the analysis of specification errors. These relationships take the form of mathematical identities. The conditions under which dispersion among different members of the k-class is a minimum are examined. It can be shown that the k-class estimators are weighted averages of the ordinary least squares and two-stage least squares estimators. Stochastic estima-

LIBRARY U. OF I., URBANA-CHAMPAIGN

tion techniques have increasingly been applied to water research problems. In particular, water demand and market studies often utilize regression and correlation methods. This article generalizes estimation methods for the water researcher and in the context of K-class estimation procedures. (Loeb-Rutgers)

EFFICIENT ESTIMATION OF DISTRIBUTED LAGS WITH AUTOCORRELATED ERRORS,
Pennsylvania Univ., Philadelphia.
Phoebus J. Dhrymes.
International Economic Review, Vol 10, No 1, pp 47-67, February 1969. 21 p, 1 tab, 11 ref, 1 append.

Descriptors: *Estimating, Markov processes.
Identifiers: *Estimation, *Distributed lag, *Autocorrelated errors, *Maximum likelihood estimators, *Likelihood function, Koyck's scheme, Lag structure, Consistency.

In this paper an expression for the estimators of the parameters of an infinite (Geometric) lag structure model which globally maximized the likelihood fuction is given. It is shown that such estimators are consistent, asymptotically unbiased and efficient. It was assumed that the error term of the model is a first order Markov process. Although this is somewhat restrictive, it is often found appropriate in econometric work. If this is indeed so, the author concludes that it would seem that the procedure herein described, which can be easily executed on a standard regression (Computer) program is to be preferred to others which approximate (Linearly) the likelihood function and employ a two step procedure. Empirical water demand and flow simulation studies may make use of distributed lag terms in the estimated equations of the model. This article has relevance to statistical water research by developing an efficient estimating technique for distributed lag structures. (Loeb-Rutgers)

LONG-RUN LINEARITY, LOCALLY GAUSSIAN PROCESS, H-SPECTRA AND INFINITE VARIANCES,
International Business Machine Corp., New York.
Benoit Mandelbrot.
International Economic Review, Vol 10, No 1, pp 82-111, February 1969. 30 p, 9 fig, 36 ref.

Descriptors: Frequency, Time series analysis, Statistical methods, Stochastic processes.
Identifiers: *Long-run linearity, *Locally Gaussian process, *H-spectra, *Infinite variance, *Econometrics, *High frequency effects, *Low frequency effects.

This paper describes the four concepts in the title of the article first separately and then through their interactions. The 'H-spectrum hypothesis' and the 'infinite variance hypothesis' are divergence hypotheses introduced to account for the main erratia aspects in the behavior of economic time series. Next to be studied are 'long-run linearity' and 'locally Gaussian processes,' which are new models added to econometrics. Most economic time series do not fulfill the independent Gaussian ideal of simplicity, even after possible gross nonstationarity has been eliminated by differencing. For analysis, discrepancies from independent Gaussian processes can be divided into two classes. The first includes 'high frequency effects,' to which the bulk of econometrics has so far been devoted. The second includes 'low frequency effects,' with which the present work is concerned. Two 'low frequency syndromes' of economics are described and are shown to be incompatible within the framework of the usual econometric models. A generalized model is constructed which allows for both syndromes. The investigation of time series problems by this article make it relevant to water simulation and flow studies and also to water demand analyses using time series data. (Loeb-Rutgers)

A FAMILY OF FUNCTIONAL ITERATIONS AND THE SOLUTION OF MAXIMUM LIKELIHOOD ESTIMATING EQUATIONS,
California Univ., Davis; and New South Wales Univ., Kensington (Australia).
Leon L. Wegge.
Econometrica, Vol 37, No 1, pp 122-130, January 1969. 9 p, 1 fig, 7 ref.

Descriptors: Regression analysis.
Identifiers: *Iteration, *Maximum likelihood, *Newton-Raphson method, *Gradient method, Convergence, Partial derivative, Likelihood function, Jacobian, FIML.

The two classical methods of finding a solution of a nonlinear system of equations are gradient methods and the Newton-Raphson method. The two methods are usually combined in such a way that the computational effort required is made as small as possible. In practice, the iterations are started with the gradient method until a point is reached that falls inside the region of convergence of the Newton-Raphson method. From there on, the iterations are continued with the Newton-Raphson method, not only because of its higher speed of convergence as compared to gradient methods, but also because in the end the partial derivatives have to be derived anyway in order to check for the second order conditions and/or to derive the covariance matrix of the estimates. The method proposed here provides an alternative to the Newton-Raphson method. Its main advantage lies in the fact that the functional form of the partial derivatives almost never has to be derived. Technically speaking, the iteration formula considered here is the same as the Newton-Raphson formula, except that the partial derivatives are replaced by suitably chosen approximations. This article could be helpful to the water researcher using such econometric methods, especially when investigating a highly nonlinear system of equations. (Loeb-Rutgers)

6B. Evaluation Process

URBAN ENVIRONMENTAL PROBLEMS: WHAT ARE WE LEARNING FROM ECONOMIC STUDIES OF WATER QUALITY,
Florida Univ., Gainesville. Water Resources Research Center.
Allen V. Kneese.
Engineering Progress, University of Florida, Vol XXI, No 6, Bulletin No 128, pp 5-18, June 1967. 13 p, 12 ref.

Descriptors: *Economics, *Water quality control, Control systems, Institutions, Theoretical analysis, Decision making, Costs, Damages.
Identifiers: *Research, Qualitative analysis.

There are four categories of important economic studies of water quality which are completed or in progress: (1) conceptual and methodological studies; (2) empirical evaluation studies; (3) studies of control systems; and (4) studies bearing upon desirable institutional change. Examples clarify the discussion of the first three categories. The concept and methodology of economic studies of water quality come from welfare economics. Empirical evaluation studies are concerned with: (1) the willingness of decision units to pay for the avoidance of damages; and (2) the cost to decision units that reduce external costs. Situations which require environmental control systems incorporating large-scale measures are described. Conclusions are: (1) Techniques for controlling water quality must result from analysis of values, contrary to the usual approach which is still focused on physical effects and objectives. Research in the economic values associated with water quality management has made significant progress, but has barely begun to illuminate many difficult problems; (2) Even carefully determined value-based rules governing decisions often cannot achieve optimal environmental quality management; more direct and explicit collective action on a regional scale is often indicated; (3) We are ill-equipped institutionally to implement those management systems and procedures which economic and engineering analysis suggests; appropriate research has hardly begun. (Gossen-Chicago)

PROSPECTUS: WATERSHED PLANNING PROGRAM FOR BUFFALO AND MCDONALD CREEKS.
Harza Engineering Co., Chicago, Ill.

Harza Engineering Company, March 1968. 51 p, 2 fig, 2 map, 10 photo, 5 tab.

Descriptors: *Drainage programs, *Flood plain zoning, *Water quality control, *Aquifers, Water supply, Planning, Inter-agency cooperation, Costs, Scheduling, Financing, Illinois.
Identifiers: Buffalo Creek Watershed, McDonald Creek Watershed.

The report examines the Buffalo Creek and McDonald Creek Watersheds in terms of geography, geology and soils, hydrology, and urbanization. It reveals an urgent need for the preparation of a coordinated drainage plan for the entire area of both watersheds. Associated needs are: maintaining the open space necessary for flood plain management improving water quality, and raising aquifer water levels. The report proposes a planning study which: quantitatively defines the functional relationships in the watershed; simulates operation of natural stream channels and water control facilities; and tests the effects of different courses of action. All planning and implementation processes would require close cooperation among governmental units concerned. A Watershed Committee with representatives from principal governmental units of the watershed is recommended and charged with sponsoring the planning program. Its structure and its need for technical assistance are discussed. Steps of the program are discussed. An estimated study schedule is 18 months. Estimated cost is $69,000. Alternative means of financing are: by a Department of Housing and Urban Development grant; by the Metropolitan Sanitary District of Greater Chicago; by the State of Illinois; and by local governments. (Gossen-Chicago)

ATTITUDES OF LOCAL RESIDENTS TOWARD WATERSHED DEVELOPMENT,
Mississippi State Univ., State College. Social Science Research Center.
Satadal Dasgupta.
Mississippi State University, Social Science Research Center, Preliminary Report 18, May 1967. 30 p, 20 tab, 6 ref, 1 append.

Descriptors: *Attitudes, River basin development, Local governments, Projects, Community development.

The general objective of the study was to delineate factors which affect the attitudes of local landowners toward watershed development programs. Attitudes were analyzed at two levels: individual and community. Two similar communities, in which similar watershed projects were already underway, were selected for study. In analysis at the individual level, four status-variables were related to attitudes toward watershed development: organizational involvement; occupation; education; and level of living. An index (IPW), composed of the variables, had a stronger relation to attitudes than each variable singly. Two situational variables were related: degree of technical contact; and participation in planning. Knowledge of watershed development represented an intervening variable both in the relationship between the IPW and at-

titudes and in the relationship between situational variables and attitudes. Community A included a greater proportion than Community B of persons with high organizational involvement, non-farm occupations, high education, high level of living, high IPW scores, and experience of flood damage. The findings suggest that Communities A and B differed in degree of favorability because they had different proportions of landowners with knowledge of watershed development. (Gossen-Chicago)

THE PROGRAM FOR WATER MANAGEMENT.
North Central Texas Council of Governments.

North Central Texas Council of Governments, undated (mimeo). 15 p, 1 tab.

Descriptors: *Watershed management, *Programs, Water supply, Water quality control, Flood control, Water allocation (Policy), Sewerage, Drainage systems, Long-term planning, Short-term planning, Costs, Financing.
Identifiers: Inter-community water supply, Inter-community water quality control, Inter-community drainage systems, Inter-basin water supply, Water recycling.

Objectives of the program are: to develop a regional planning-and-development programming system which will insure the availability of an adequate water supply for the North Central Texas region; attainment and maintenance of desirable water quality standards; mitigation of flood problems; and development and maintenance of adequate water distribution, sewerage, and drainage systems. The program considers interbasin water supply relationships; water supply, quality control and drainage among communities; and intra-community distribution of water and collection and treatment of sewerage. The expected work program is described in sequence from February, 1968 to June, 1969. A table shows the development of work from the first steps, which are identification of sewerage system areas, water system areas, and drainage system areas, to the last steps, which include demonstrations of sewerage systems, of water recycling, and of drainage systems, a watershed demonstration, and a continuing planning program. Intermediate activities include evaluation of existing systems and of the plan's adequacy, designing a regional water quality monitoring system, establishing a flood damage rating system, and developing short-range, and interim plans. Outputs of the program will be applied in the areas of water management policy and of a comprehensive regional information system. Costs, funding, and supervision are discussed. (Gossen-Chicago)

SOCIOLOGICAL AND SOCIAL PSYCHOLOGICAL FACTORS RELATED TO METROPOLITAN WATER RESOURCES DEVELOPMENT,
Utah State Univ., Logan.
Wade H. Andrews.
Institute for Social Science Research on Natural Resources; Institute Series: Special Paper No 2, November 1968. 7 p.

Descriptors: *Water resources management, *Water resources development, Social values, Psychological aspects, Water demand.
Identifiers: *Social psychology, *Interdisciplinary research, Social organization, Social action, Diffusion of ideas, Sociological methodology.

The problem of interdisciplinary work is discussed with stress placed upon the problems of communication between the various fields due to differing jargons of expression; problems of different methodologies or approaches to problems; different levels of development regarding methodology; and, widespread specialization within individual fields. The remainder of the article deals with aspects of social psychology and sociology which are related to water problems. The aspects considered include values, social organization, social action, the process of diffusion of ideas and research methodology. Emphasis is placed on the very small amount of research being conducted on sociological aspects of water resources development. Six such research projects are briefly described. (Davis-Chicago)
W69-06853

TOWARD THE SOCIOLOGICAL ANALYSIS ON NATURAL RESOURCES AND SOCIETY,
Utah State Univ., Logan.
Wade H. Andrews.
Institute for Social Science Research on Natural Resources; Institute Series: Special Paper No 1, September 1968. 12 p, 34 ref.

Descriptors: *Natural resources, *Pollution abatement, *Water resources, Land resources, Wildlife, Motivation, Attitudes.
Identifiers: *Sociology, Social problems, Social structure, Resource use, Mineral resources.

Natural Resources provide a new direction for sociological research based on the social systems, patterns of behavior, motivation, values and attitudinal aspects associated with and structures around natural resources. The need to pursue these studies was based on the following assumptions regarding the importance of natural resources: (1) population growth is increasing the demand upon natural resources; (2) there is a finite limit to resources; (3) certain resources are irreplaceable; (4) a growing sense of aesthetics; (5) pollution must be controlled; (6) order in development is necessary for future well-being; and, (7) planning is the basis for this order. This sociological study of natural resources can be approached from four viewpoints: (1) the resource itself as a point of departure; (2) a stress on the uses of resource; (3) the identification of social problems related to resources; (4) the relationship of resources to social structure. These topics are then discussed in regard to a typology of resources. This typology includes: water resources; land resources; mineral resources; forestry and wilderness; wild life; and, the special problem of resource pollution. (Davis-Chicago)

THE RELATION OF WATER RESOURCES TO THE INDUSTRIAL AND RECREATIONAL POTENTIAL OF THE MISSISSIPPI GULF COAST,
Mississippi State Univ., State College. Water Resources Research Inst.
A. A. Armenakis, R. F. Pearson, and W. P. Neely.
Water Resources Research Institute, Mississippi State University, 1968. 186 pp, 6 fig, 8 map, 44 tab, 128 ref, 2 append.

Descriptors: *Water resources, *Mississippi, Water quality, Industries, Training, Industrial wastes, Transportation, Water resources development, Recreation facilities, Recreation demand, Human population, Average income, Education, Economic life, Utilities, Communication, Natural resources, Climatic data, Topography, Drainage, Geology, Hydrology, Groundwater, Surface waters, Legal aspects.
Identifiers: *Industrial potential, *Recreational potential, Jackson County (Miss), Harrison County (Miss), Hancock County (Miss), Industrial distribution, Industrial facilities.

After outlining the purpose, scope, and methodology of the study, the report surveys the characteristics of the study area, which includes Jackson, Harrison, and Hancock Counties in Mississippi. Characteristics discussed are: population breakdown, population trends, income per capita, race breakdown, education breakdown, present and planned housing, economic development, utilities, governmental structure, communications, location, natural resources, non-water transportation, climate, topography and drainage, and geology and hydrology. Chapter III discusses fresh water resources of each county, problems in quality of surface water and groundwater. Chemical analyses of surface and groundwaters, and legal restrictions concerning stream pollution. Chapter IV discusses industrial distribution, industrial facilities and industries of each county, vocational education, and the gulf coast fishing industry. Chapter V discusses present industrial water consumption, projected future demand, and industrial pollution. Chapter VI analyzes major water-using industries from a mail questionnaire and follow-ups. Chapter VII discusses salt water transportation. Chapter VIII studies proposed developments of water resources in each county. Chapter IX discusses recreational facilities of the Mississippi Gulf Coast. It covers the national demand for recreation, assets of the Mississippi coast, and several proposed and existing facilities. Chapter X studies the industrial and recreational potential of the Mississippi Gulf Coast. (Gossen-Chicago)

ECONOMIC EVALUATION OF A WATER RESOURCES DEVELOPMENT PROJECT IN A DEVELOPING NATION,
California Univ., Berkeley. Hydraulic Engineering Lab.
Fereidoun Mobasheri.
Calif Univ Water Resources Center Contrib No 126, July 1968. 191 p, 14 fig, 30 tab, 79 ref, 2 append. OWRR Proj No A-003-CAL and B-041-CAL.

Descriptors: *Water resources development, *Economic justification, *Economics, Cost-benefit analysis, Social values, Social needs, Labor supply, Water supply, Engineering structures, Engineering estimates, Irrigation, Crops, Hydroelectric power, Aquifers, Planning.
Identifiers: *Developing nation, Economic evaluation.

This study presents a detailed economic evaluation of water resources in any developing nation on the basis of experience obtained in conducting water resources surveys and water control in the developed nations. The monograph discusses the following: some characteristics of developing nations and the aims of economic planning; approaches for economic evaluation of public investment projects; the concept of benefit-cost analysis and need for its modification; modification of benefit-cost analysis, synthesis of a new criterion; and optimum design of a multiple purpose water resources project. It is concluded that whenever investment in a water project is considered, questions such as what is the economic value, what is the optimal scale of development, and what is the economic rating of the project, among alternative projects, should be answered. A sensitivity analysis is summarized and considers the annual rate of GNP growth, balance of payments equilibrium, and underemployment of unskilled labor force. (Gabriel-USGS)

REGIONAL DEVELOPMENT AND THE RURAL POOR,
Kentucky Univ., Lexington.
Niles M. Hansen.
The Journal of Human Resources, Vol 4, No 2, pp 205-214, Spring 1969. 10 p, 1 tab, 15 ref.

Descriptors: *Industries, *Migration, *Unemployment, *Human resources, *Costs, government, Rural areas, Investment, Taxes, Area development, Wages, Priorities.

LIBRARY U. OF I., URBANA CHAMPAIGN

Identifiers: *Poverty, *Social costs, *Federal programs, Opportunity costs, Subsidies, Tertiary sector, External economics.

The regional policy of the President's advisory Commission on Rural Poverty is based on the assumption that the social costs of bringing industry to relatively poor regions would be less than the social costs involved in the migration of workers and increased congestion and unemployment in industrial areas. This presents a problem for water resource development in previously unindustrialized areas. Federal programs to influence the quality of human resources in lagging rural areas benefit the people of these regions and the nation as a whole. Opportunity cost considerations favor federal subsidies for investment in education, health, and training in lagging regions, as well as for relocation subsidies and information programs to facilitate rational migration towards intermediate regions where growth is rapid but where congestion poses no immediate threat. Recently, some research has pointed out the potential income redistribution effects of water projects. The possible income effects on rural poverty areas generated by water developments makes this article relevant to the regional planner. (Murphy-Rutgers)

PERPLEXING PROBLEMS IN DECISION THEORY,
Massachusetts Inst. of Tech., Cambridge.
Billy E. Goetz.
The Engineering Economist Vol 14, No 3, pp 129-140, Spring 1969. pp 12, ref 8.

Descriptors: *Dynamic mathematical model, *Decision making, *Priorities, Discount rate, Overhead cost.
Identifiers: *Quantitative models, *Decision models, *Utility transforms, *Aggregation level, *Algorithmic solution, Periodic reports, Hypothesis, Total net cash flow.

An objective of this article was to present arguments important to potential research projects. In sequence, these points included determining the scope of the problems, and in what order they should be treated. Hypotheses should then be created and selected, hopefully to incorporate risk into decision making models and to determine aggregation levels for such items as cash flow, increments, overhead costs, and time horizon. A dynamic model of the system under study is suggested, with an integrated view resulting from a quantitative model that is subject to algorithmic solution. This method might help to systematize research and lessen intuition, and would therefore be helpful to the water researcher. (Murphy-Rutgers)

UTILITY AS A SURROGATE FOR VALUE IN WATER RESOURCES ANALYSIS,
Rutgers - The State Univ., New Brunswick, N. J.
William Whipple, Jr.
The Engineering Economist Vol 14, No 3, pp 159-167, Spring 1969. pp 9, ref 9.

Descriptors: *Water-resource development, *Water pollution control, *Systems analysis, *Decision making, Optimization, National income.
Identifiers: *Utility benefit approach, *Intangible aspects, *Utility analysis, *Net utility advantage, Net output, Water resources system, Minimization of cost.

This article proposes a utility benefit approach to water-resource development to maximize net output of goods and services in view of the constraints imposed by intangible aspects. The utility approach would permit a determination of the national effect of water-pollution control, and would facilitate systems analysis of water-resources systems to aid pollution control. Utility benefit analysis should be applied in this area, since its analytical advantages result is a series of alternatives evaluated in utility terms including the intangibles involved. Any evaluation of these intangibles should be opinion, since the matter is not subject to objective determination. A systems analysis of these intangibles presents difficulties, which can be avoided by confining the analytical process to minimizing the cost of achieving an objective decided upon based on the intangibles. This alternative does not evaluate national income and product in relation to the proposal, and thus the utility analysis has the greatest probability of increasing national welfare, when balanced against intangible effects. ECONOMIC ASPECTS OF WATER RESOURCE POLICY,
Wisconsin Univ., Milwaukee.
Mason Gaffney.
The American Journal of Economics and Sociology, Vol 28, No 2, pp 131-144, April 1969. 14 p

Descriptors: *California, *Water policy, *Water resources, *Water development, *Irrigation districts, *Marginal costs, *Capital, *Aquifers, *Irrigation, *Water rights, *Riparian doctrine of water rights, Storage, Drainage, Motivation, Political aspects.
Identifiers: *Pooling, *Community action, *Diminishing returns, *Water systems, Compactness, River development, Spillover benefits, Rationing.

A description is given of what the author has learned from the experience of the Western States in economizing on water for the purpose of aiding eastern researchers. The need for community action in the area of water resources is pointed out with a discussion of the benefits of the irrigation districts originating in California. State action is also needed, primarily in the area of defining property rights in water. It is necessary for the federal government to define interstate water property questions and it should redirect its own priorities in the water resources area. With water becoming increasingly scarce and riparian doctrine of water rights is unsatisfactory and the reasons necessitating its abandonment are presented. Likewise, the reasons for the failure of the appropriative doctrine of water rights are discussed. There has been a failure to economize on rent-bearing waters which results in the wasting of local waters adding to the already highly expensive conveyance and distribution problems. The fact that water evinces diminishing returns suggests several corollaries which are discussed. The acute capital shortage and high interest rates should not stop the necessary water supply investments. (Murphy-Rutgers)

AGGREGATE PRODUCTION FUNCTIONS AND TYPES OF TECHNICAL PROGRESS: A STATISTICAL ANALYSIS,
Brown Univ., Providence, R. I.
Martin J. Beckmann, and Ryuzo Sato.
AER, Vol 59, No 1, pp 88-101, March 1969. 14 p, 6 tabs, 13 ref, 1 append.

Descriptors: Regression analysis, United States, labor, capital.
Identifiers: *Aggregate production function, *Technical progress, CES function, Neutrality, Cobb-Douglas production function, Neutral technical progress, Japan, Germany.

One of the difficulties encountered in estimating the rate and type of technological progress is that of accurate specification of the aggregate production function and the type of technical progress. In recent work the type of production function most commonly applied is the CES function. In this paper the authors examine the case where exogenous forms of technology are assumed. For theoretical and technical convenience, 'neutrality' in the sense of Hicks or Harrod is assumed. Complications arise due to the fact that problems of specification of the form of a production function and the form of technical progress are not independent. The paper discusses the close connection between the form of a production function in general and the type of exogenous technical progress, that would be consistent with a given form of a production function. It is also shown that various new types of 'neutral' technical progress can be meaningfully determined and that the standard definitions of Hicks and Harrod are reclassified in a more general framework. The paper examines some results by presenting statistical evidence on the forms of production functions and on the types of technical progress. A considerable economic literature exists on production function analysis on both theoretical and empirical levels. The analysis of water supply problems via a production function approach is a natural extension of this literature and as such this article treats the problems of introductory technical change into production analysis. TECHNICAL PROGRESS AND INVESTMENT,
Osaka Univ., (Japan).
Susumu Koizumi.
International Economic Review, Vol 10, No 1, pp 68-81, February 1969. 14 p, 5 fig, 11 ref, 1 append.

Descriptors: *Investment, Capital, Costs, Linear programming, Marginal costs.
Identifiers: *Technical progress, *Acceleration model, *Capital-stock adjustment model, Capital accumulation, Substitutes, Investment decision, Capital-labor ratio.

Recent years have seen many studies, empirical as well as theoretical, on the investment function. Little has been said, however, about the effects of technical progress on investment decisions, whereas nobody would deny the importance of technical progress in the process of capital accumulation. The present paper aims at advancing a theory of investment under a situation in which the type of technical progress taking place is of a form which introduces a new technique to produce an already existing product or a new close substitute thereof. The author presents a theoretical model of investment which incorporates the effects of technical progress. The relation between technical progress and the economic life of capital goods are discussed. The implication of the investment model is clarified and an interpretation of the model as a version of the acceleration model is presented. This is of importance to researchers investigating investment decisions in the water area due to the important role played by technical progress in water resource development. (Loeb-Rutgers)

A NOTE ON DEMAND FOR PUBLIC GOODS,
Social Security Administration, Washington, D. C.
Ronald F. Hoffman.
The Canadian Journal of Economics, Vol 11, No 1, pp 125-120, February 1969. 6 p, 1 fig.

Descriptors: Probability, Competition, Marginal costs, Risks.
Identifiers: *Public goods, *Output consumption, *Externalities, Conflict, Preference, Exclusion principle.

The purpose of this note is to suggest a model of the world of competition, uncertainty, and externalities in output consumption, in which individuals maximize their own self-interest while revealing their preference for public goods. The model offers an explanation of the motive which leads individuals who maximize conflicting self-interest to reveal their preferences for public goods. The author's basic idea is that each individual behaves so as to maximize his expected utility from a proposed incremental public expenditure. The occurrence of the proposed increment is uncertain because it is contingent upon adequate finance; the community must provide payment. Each individual possesses a subjective probability distribution of occurrence; he presumes there is a positive relation between his bid and the associated probability that the offer of

the total community will be sufficient to finance the marginal cost of the increment. The individual reveals his true preference in the form of an offer to share in the cost of the increment. Water projects and their associated benefits often contain significant public-good components. The public good nature of water frequently leads to pricing and benefit measure problems for the developing authorities. This discussion of this article may have some applications in designing benefit and pricing schemes for water development projects. (Loeb-Rutgers)

CONDITIONAL PREDICTION AND UNBIASEDNESS IN STRUCTURAL EQUATIONS,
Massachusetts Inst. of Tech., Cambridge.
Gordon M. Kaufman.
Econometrica, Vol 37, No 1, pp 44-49, January 1969. 6 p, 6 ref.

Descriptors: Forecasting, Least squares method, Regression analysis.
Identifiers: *Conditional prediction, Unbiasedness, Structural equations, Conditional least squares.

Sewell has discussed a generalized version of a problem of conditional least squares estimation treated earlier by Waugh and Srinivasan. The purpose of this note is twofold: first, to give an alternative proof of Sewell's main result that leads to some ancillary facts about conditional least squares estimators; second, to present direct methods for evaluating the normalizing constant of the generalized multivariate t density and for computing the expectation of the random matrix (W) inverse when S is Wishart distributed. The expectation of (W) inverse is needed to compute the covariance matrix of the generalized multivariate t density. The constant mentioned above as well as the expectation of (W) inverse can be derived indirectly by considering a moment generating function. The extension of econometric methodology makes this article relevant to the water researcher concerned with econometric techniques. (Loeb-Rutgers)

UNEMPLOYMENT, IDLE CAPACITY, AND THE EVALUATION OF PUBLIC EXPENDITURES,
Grinnell Coll., Iowa; and Resources for the Future, Inc., Washington, D. C.
R. H. Haveman, and J. Krutilla.
Baltimore, Maryland, Johns Hopkins Press, 1968. 159 p.

Descriptors: *Water resource development, *Cost-benefit analysis, Unemployment, Costs.
Identifiers: *Public investment criteria, Occupational labor demand, Opportunity costs, Shadow adjustment, Market costs, Primary inputs, Economic capacity, Input-output.

Public expenditure criteria, with assumed full employment, has been increasingly applied to the process of choosing among alternative public expenditures and the process of designing public works projects. If substantial unemployment exists market cost and price data become of little value and a problem of estimating appropriate benefit and cost adjustments for benefit-cost analysis arises. Recently, new sources of data have become available which enable the development of models which trace the final bill for expenditures to the factor sources which supply the primary inputs to public expenditures. These models are presented and implemented. Relationships are developed to estimate the percentage of labor required for the construction of public projects which will be drawn from the idle pool. Industrial output demands and estimates of capacity utilization by industry serve as the basis for developing estimates of the percentage of capital facilities used which were idle. This study, then, evaluates the opportunity cost of public expenditures in periods of less than full employment by analyzing one type-water resource development--among the whole range of public expenditures. INDUSTRIAL FLOOD LOSSES: DAMAGE ESTIMATION IN THE LEHIGH VALLEY,
Chicago Univ., Ill.
R. W. Kates.
Chicago, Illinois, University of Chicago Press, 1968. 76 p.

Descriptors: *Water resource development, *Optimum development plans, *Delaware River, *Flood damage, River basin development, Industrial production flood proofing.
Identifiers: *Lehigh Valley, *Methodology, *Stage-demand functions, Synthetic estimates, Managerial behavior, Production loss, Factors of production.

This book is an extension of two previously developed lines of research in water-resource management. The first has to do with optimal design of river basin systems. Thus, in the first part the assumptions and procedures that underlie the estimates of damage, that serve as measures of flood control benefits are reviewed. This serves as a benchmark from which to assess the techniques of constructing synthetic damage estimates. Synthetic damage estimates, under alternative assumptions of managerial behavior, had been prepared for commercial and residential land uses for one town. This technique had been extended to other towns differing in physical characteristics of flooding. This line of research was further related to industrial properties in the heavily industrialized Lehigh Valley. Part two reports the result of this research, presented largely in the form of synthetic stage-demand functions for industrial properties under different assumptions of economic evaluation and human adjustment. POLICY ISSUES AND PROBLEMS IN OUTDOOR RECREATION,
Pennsylvania State Univ., University Park. Inst. for Research on Land and Water Resources.
John C. Frey, and Hays B. Gamble.
Journal of Farm Economics, Vol 49, No 5, pp 1307-1317, December 1967. 11 p, 2 fig, 10 ref.

Descriptors: *Recreation, *Welfare, Recreation demand, Recreation facilities, Pricing, Costs, Taxes, Profit, Supply, Demand, Benefits.
Identifiers: *Policy issues, *Market mechanism, Marginality, Marginal rate of substitution, User charge, Consume, Transportation costs, Consumer preferences.

The primary intent of this paper is to establish a rationale based on economic logic for maximizing efficiency and welfare in outdoor recreation. The authors attempt to show the necessity for a market mechanism in outdoor recreation if resource allocation, firm efficiency, and consumer welfare objectives are to be met. Knowledge of consumer preferences for outdoor recreation is necessary for efficient allocation of resources and may best be achieved through a market pricing system for recreational services. Consumer welfare may be further increased by reducing transportation costs and by locating new outdoor recreation facilities as close as possible to large population centers. In view of current social value judgments plus private capital limitations, there appears to be a strong need for continued public involvement in outdoor recreation. A pricing policy for multipurpose operations may be necessary for efficient allocation of factors in both the public and private outdoor recreation sectors. To accommodate the advantages of institutional control offered by public ownership, plus the desirability of the profit-maximizing objective which accompanies private development, a joint public-private partnership business venture is suggested as an alternative for future expansion of the outdoor recreation industry. The crucial role of water in most outdoor recreation makes this article relevant to the water resources area. (Loeb-Rutgers)

DISCUSSION: POLICY ISSUES AND PROBLEMS IN OUTDOOR RECREATION,
Bureau of Commercial Fisheries, Washington, D. C.
Virgil J. Norton.
Journal of Farm Economics, Vol 49, No 5, pp 1317-1320, December 1967. 4 p, 3 ref.

Descriptors: *Recreation, Welfare, Cost-benefit analysis, Risks, Constraints.
Identifiers: *Policy issues, Pareto optimality, Public policy, Labor mobility, Ignorance.

This paper refers to the previous paper by Frey and Gamble. The author considers the basic public policy question; what type, amount, and share of outdoor recreation services and facilities should the government provide. This question cannot be answered solely within the context of Pareto optimality. Economists doing research in the area of outdoor recreation must be aware that research results are utilized in decisions which result in welfare reallocation. It is important to provide an adequate information base so that all alternatives can be equally considered. To the extent that this has not been done, it is possible that the stage has been set for economic research results to misguide the allocation of outdoor recreation expenditures, not because of incorrect information but simply because of lack of sufficient data, particularly related to certain alternatives. The author suggests that research aimed at developing concepts for measuring recreation values of 'user-type' activities be encouraged. It is suggested that the role of government should be to eliminate constraints, (risks, uncertainty, lack of mobility, and ignorance), rather than to acquire or regulate property for outdoor recreational uses. The important role of water in outdoor recreation usage makes this article relevant to the water researcher. (Loeb-Rutgers)

EXTERNALITIES AND EMPIRICISM IN WATER RESOURCES,
Economic Research Service, Washington, D. C.
Adam A. Sokoloski.
Journal of Farm Economics, Vol 49, No 5, pp 1521-1525, December 1967. 5 p, 2 tab, 9 ref.

Descriptors: *Water resources, Management, Benefits, Oregon, Water quality, Demand, Costs, Fishing, Input-output analysis, Income.
Identifiers: *Externalities, *Empiricism, Group action, Price alteration, Inputs, Outputs, Market interaction, Secondary effects, Yaquina Bay, Engineering measures.

The purpose of this paper is to present one interdisciplinary technique which will supply empirical measures of external effects in water resources and their relation to group action and management. The paper follows the traditional delineation of technological and pecuniary externalities. However, the inclination to exclude the latter as a separate decision element is resisted. In the simplified example, firm A follows a production or consumption pattern which affects firm B, although B has no control over this situation. The effect on B results in price alterations in B's inputs and/or outputs and this in turn will reverberate through activities subsequently involving firm C in its dealings with B. There is the tendency among economists to relegate this interrelationship between B and C to the abyss of 'normal' market interactions. It is argued here that these pecuniary externalities, often referred to as secondary effects, are crucial to management policy. Isolating these effects within market interactions and relating them to the

LIBRARY U. OF I., URBANA-CHAMPAIGN

originating activity in common with the technological interaction will provide crucial assistance in the decision making process if empirical measures can be generated. The externalities usually assigned to 'water production' make this article relevant to the water researcher. (Loeb-Rutgers)

THE TVA TRIBUTARY DEVELOPMENT PROGRAM,
Arkansas Coll., Batesville.
Donald T. Wells.
University, Alabama, University of Alabama Press, 1964. 153 p.

Descriptors: *Tennessee Valley Authority, *Watersheds, *Resource development, Planning, Cost allocation, Benefits, Political aspects, Financing.
Identifiers: *Watershed management, *Watershed financing, *Beech River Authority, Tributary development, Resource mix, Tributary organizations.

The monograph is concerned primarily with the tributary area program of the Tennessee Valley Authority. The first chapter describes the background and development of the program within the TVA. The next chapter deals with the intergovernmental aspect of the watershed program. The monograph then discusses the various patterns of organization in watershed administration. The relationship between planning and watershed development is then examined. The economics of watershed financing are discussed in depth. Various methods of current financing are explained. The experimental methods in the Beech River Watershed are discussed in detail since they represent an attempt to develop a formula for the allocation of cost between the federal government and the Beech River Watershed Development Authority on the basis of estimated benefits. Discussions of inter-agency relationships, state and local politics and democratic control in watershed development follow. (Murphy-Rutgers)
W69-07183

WELFARE ECONOMICS AND SUBSIDY PROGRAMS,
Florida Univ., Gainesville.
Milton Z. Kafoglis.
University of Florida Monographs No 11, University of Florida Press, Gainesville, Florida, pp 1-83, Summer 1961. 83 p, 14 fig, 45 ref.

Descriptors: *Welfare, *Taxes, Income, Social values, Demand, Equilibrium, Pricing, Indirect benefits, Costs, Prices.
Identifiers: *Subsidy program, *Subsidy, *Highway finance, Conflict, Income distribution, Social marginal costs, Collective allocation, Social allocation.

This study attempts to select and apply a body of economic welfare criteria for the financing of those governmental programs which 'subsidize' private economic activity. The chief financial characteristic of such programs is that they rely on revenue derived from both prices and subsidies. Examples may be found in the transportation and public utility industries, the postal service, school programs, health and social insurance programs, programs for the protection and development of infant industry, and many others. In these areas, the subsidy and its corollary, the tax, represent values which the market either overlooks or deliberately rejects. Subsidies are granted and the required taxes are imposed on the assumption that the private or market production and consumption of goods and services will be altered so as to reflect certain social valuations. Subsidies and taxes, therefore, represent a difference between market and social valuation. But such payments cannot be determined efficiently until the unexpressed social magnitudes are at least defined and, if possible, measured. This study attempts to bring together into a systematic framework several strands of economic analysis--price theory, tax theory, and welfare economics. Public subsidy provides the focal point around which the framework is developed and highway finance provides the policy problem to which the framework is applied. Tax and subsidy programs have potentially large roles in water investment and development projects and accordingly this article is relevant to the theoretical evaluation of these programs in water resources problems. (Loeb-Rutgers)
W69-07186

THE MEASUREMENT OF SOCIAL WELFARE,
Northwestern Univ., Evanston.
Jerome Rothenberg.
Englewood Cliffs, New Jersey, Prentice-Hall, Inc, pp 1-357, 1961. 357 p, 19 fig, 8 tab, 284 ref, 6 append.

Descriptors: *Welfare, Value, Compensation, Taste, Marginal utility.
Identifiers: *Social welfare, *General Possibility Theorem, *Compensation principle, Value judgment, Kenneth Arrow, Social welfare function, Economic welfare function.

This book focuses on the question of what the fundamental criterion of social welfare must be in order that a developed welfare analysis can be relevant to guide policy decision. Three characteristics are considered appropriate. First, the standard must be internally consistent. Second, it must enable us to compare a large portion of the policy alternatives before use. Third, it must be compatible with relevant values prevailing in the community. The point of departure of the study is the finding by Arrow that if the standard be fashioned to reflect a particular interpretation of 'rational' evaluation and in addition bear the kind of correspondence to the values of the individuals in the community which we call consumer sovereignty, then the standard will necessarily be internally inconsistent. This book is partly an attempt to see how restrictive Arrow's finding is, and how best to by-pass it so as to form a useful analytic apparatus. Part I sets forth the basic problem and examines Arrow's analysis in detail. Parts II, III, and IV examine a wide variety of approaches in the welfare literature in order to discover how useful are the criteria of choice which they generate. The 'New Welfare Economics,' approaches introducing degrees of cardinality into individual utility indicators, and other approaches resting on specific group uniformities in individual preferences and on group value judgments concerning inter-personal comparability of social welfare impact are analyzed. The public good aspects and social welfare implications of water, water investment and water development projects make the subject matter of this study important to the water research area. (Loeb-Rutgers)

A SURVEY OF WELFARE ECONOMICS,
London School of Economics and Political Science (England).
E. J. Mishan.
Economic Journal, Vol 70, pp 197-265, June 1960. 69 p, 11 fig, 250 ref.

Descriptors: *Welfare economics, *Optimization marginal cost, Prices, Capital.
Identifiers: *Compensation tests, *Community welfare, *Indifference curves, *Welfare criteria, Consumer surplus, Marginal rate of substitution.

The author wishes to present a survey of the developments in the area of welfare economics. He is concerned only with the theoretical aspects and not in the application. Welfare economics involve the ranking of alternative economic situations open to society. Since it is concerned with community welfare it requires several ethical judgments, which are discussed. The author also devotes some time to the kind of methodology needed for such an analysis. The developments of the thirties and then from 1939 on are summarized. A major portion of the article is devoted to the controversy over welfare criteria with particular emphasis given to the contributions of Scitovsky, Little, Pigou, Samuelson and Arrow. The remainder of the article is devoted to the concept of consumer surplus. The author concludes with an evaluation of the inability of welfare economics in its present state to reveal the effects on human happiness of increasing affluence. In terms of the social welfare benefits of water resource development, this article provides a comprehensive summary of the theoretical literature of welfare economics. (Murphy-Rutgers)

BIOLOGICAL AND ECONOMIC ASPECTS OF FISHERIES MANAGEMENT,
Washington Univ., Seattle.
James A. Crutchfield.
College of Fisheries and the Department of Economics of the University of Washington at Seattle, February 17-19, 1959. 160 p.

Descriptors: *Foreign trade, *Fish management, *Fisheries.
Identifiers: *Management, *Political limitations, *Sociological limitations, *Economics in fishery management, Biology in fishery management, Halibut fisheries.

The book presents articles by different authors under several main headings. The first main section is on the biological and economic aspects of fishery management. This contains articles on management techniques available to fisheries management, biology and economics in fishery management, and the political and sociological limitations of fishery management. The second section deals with halibut fishery management and contains articles on management practices, economic effects of regulation, and the limitations of management. The third section deals with salmon management in Alaska with articles on the management and financial problems and the economic effects of regulation. The last section contains articles on international trade policies and their relation to fisheries. The articles within the section deal with the effect of trade on U.S. fisheries, recent developments in fishery methods and the effects of technological developments on the fishery industry. Since it is concerned with an important area of water resource planning this book should be a helpful reference to those working in the area. (Murphy-Rutgers)

ECONOMIC EFFECTS OF REGULATION OF THE PACIFIC HALIBUT FISHERY,
F. Heward Bell.
In Biological and Economic Aspects of Fisheries Management, College of Fisheries and the Department of Economics of the University of Washington at Seattle, pp 51-75, February 17-19, 1959. 75 p, fig 7, tab 6, ref 27.

Descriptors: *Prices, *Competition, *Fishery, *Management, *Regulation, Indirect costs, Capital, Population, Conservation.
Identifiers: *Production, *Yields, *Markets, Input-output ratio, Marine resources.

The article presents an answer to those economist who have claimed the management of the Pacific halibut fishery by the International Pacific Halibut Commission to be an economic failure. The gains in output by the regulated fishery are listed. The author answers the main criticisms of fishery management dealing mainly with the socioeconomic objections, questions relating to the type of markets in which the fish were disposed of and gives a lengthy discussion of the results of previous economic studies of the Fishery. The predictable and increasing production of the fishery provides a stabilizing element to the fluctuating Northwest fishing industry, thus benefiting the general regional economy. The joint regulation of the halibut fishery has been a highly successful experiment in management of an important water resource area bringing wealth, employment and food for the people of both Canada and the United States. (Murphy-Rutgers)

N ANALYSIS OF ALTERNATIVE METHODS F FINANCING TYPES OF WATER ESOURCE FACILITIES IN MISSISSIPPI,
ississippi State Univ., State College. Water esources Research Inst.
uy T. Peden, J. R. Pulley, and J. L. Roberts.
ater Resources Research Institute, Mississippi ate University, 1968. 62 p, 1 fig, 16 tab, 21 ref, 3 ppend.

Descriptors: *Financing, *Municipal water, Mississippi, Government supports, Grants, Loans, Initial costs, Maintenance costs.
Identifiers: *Water associations, Farmers Home Administration loan, Bond issue, Operating revenue, Water facilities.

The analysis of 50 water association and 24 municipalities in central Mississippi had four objectives: (1) determine the type of water facility needed; (2) determine underlying factors causing this need; (3) determine the success of financing method used; and (4) determine and analyze problem areas resulting from the method of financing chosen. Three sets of questionnaires and follow-ups were used for Associations. Personal interviews with the Mayor, city, clerk, or a representative of either were used for municipalities. In financing original water systems, most associations utilized the terms of the maximum Farmers Home Administration loan. Deviations were small incorporated municipalities. Associations involved in improvements and/or extensions to their original systems are discussed. Problems of associations in obtaining funds and managing systems are discussed. After differentiating municipalities from associations, the report defines characteristics of the municipal study area. Types of facilities constructed and their costs are discussed. Methods of financing include: (1) private loan; (2) cash operating revenue, or retained earnings; (3) bond issue; and (4) government loan or grant. Existing source (s) of funds for each municipality are discussed. No common, general financing problems appear, but individual problems of different communities are discussed. (Gossen-Chicago)

RIGHTS, POWERS, DUTIES, MUNICIPALITIES.

Minn Stat Ann secs 465.18, 465.19, 465.26 to 465.29, 465.48, 465.49 (1947).

Descriptors: *Minnesota, *Ownership of beds, *Navigable waters, *Flood control, Cities, Rivers, Streams, Alteration of flow, Legislation, Navigation, Lakes, Dams, Water levels, Eminent domain, Condemnation, Taxes, Assessments, Government finance, Diversion, Channels, Dredging, Channel improvement, Nonnavigable waters, Regulation.

The ownership of beds of all navigable rivers in Minnesota is in the state, subject only to regulations of Congress and lawful public use. When any portion of the channel of such navigable river within the city limits of a municipality is changed by any authority for the improvement of navigation, and the city bears some of the cost of such change, the beds, abandoned due to the change, shall belong to the city. Larger cities may, for promotion of public welfare, divert any nonnavigable stream flowing within its limits from its natural bed to another channel. Cities may also regulate the flow of such streams by controlling discharge of lakes, and by improving the channels as necessary. The exercise of the power of eminent domain and the power to levy assessments is regulated. Certain cities have the authority to dredge lakes within their city limits, to maintain a water level therein and to park the shores of such lakes. Emerging flood prevention lands, financed through special tax levies, have been created in smaller cities. Larger cities are authorized to finance flood control measures by issuing bonds. A SHORT CUT TO CAPITAL BUDGET FORECASTING FOR PUBLIC UTILITIES,
J. F. Brennan.
Engineering Economist, Vol 14, No 3, pp 151-158, Spring 1969. 8 pp, 1 fig, 1 tab, 3 ref.

Descriptors: *Forecasting, *Budgeting, *Laplaces equations, Computers, Projections, Financial planning, Depreciation, Growth rates.
Identifiers: *Input data, *Optimization of capital structure, *Budget estimator, *Integral equation, *Parameters, Plant balance, Growth pattern, Frequency curve.

This article presents a method of forecasting the capital budget for public utilities on a short-term or long-term basis, through the use of Laplace transforms. This method was proposed as a short-cut around the mass of detail generally characteristic of such estimates. It is noted that certain elements of such budgets will always require individual attention; this method is designed to treat the majority of data en masse with acceptable estimating tolerance. To attain this, the capital budjet must provide for replacing equipment as it retires, provide for the subsequent replacement of the replacements, and provide for the new capital expenditures necessary to sustain the predicted growth. To achieve this ideal, this method suggests input data of only the present plant balance, its average age, estimated average life and growth pattern in the recent past. Computer time for a ten-year projection, by years, is less than ten seconds. This method can be quickly applied to meet a changing condition, such as inflation. Due to the importance of capital budgeting in water research and development this article suggests a method which may be used for water problems. (Murphy-Rutgers)

THE REGULATION OF QUEUE SIZE BY LEVYING TOLLS,
Technion - Israel Inst. of Tech., Haifa; and North Carolina Univ., Chapel Hill.
P. Naoy.
Econometrica, Vol 37, No 1, pp 15-24, January 1969. 10 p, 1 tab, 3 ref.

Descriptors: *Queueing theory, Profit, Costs, Income.
Identifiers: *Queue size, *Tolls, *Public good, Service station, Rewards, Traffic density, Laissez faire, Subsidies.

A queueing model--together with a cost structure--is presented, which envisages the imposition of tolls on newly arriving customers. It is shown that frequently this is a strategy which might lead to the attainment of social optimality. The basic features of the model are shaped by the assumption of the existence of a public good and by the assumption of possible non-admission of customers to the service station. Rewards are considered to be constant and equal. Again, no basically different results would have been obtained had these rewards been drawn from a distribution. A strong modification may be called for if it were assumed that the reward obtained depends in some way on the effective traffic density. It can be shown that a policy of 'laissez faire' is only rarely and accidentally a correct one. In this more general case, in which effective interaction between customers and therefore dependence on traffic density is assumed, the proper strategy is not necessarily the imposition of a toll. Cases can be constructed where the handing out of subsidies to joining customers optimizes public good. This article could be applicable to water problems due to the public good aspect of water and the problems of water allocation which might require a queueing type of approach. This article is also relevant to the admissions policies of water recreation sites. (Loeb-Rutgers)

ON THE NATURE AND SIGNIFICANCE OF SOCIAL COSTS,
Basel Univ. (Switzerland).
K. William Kapp.
Kyklos, Vol 22, Fasc 2, pp 334-347, 1969. 14 p.

Descriptors: *Economics, *Costs, Resource allocation, Air pollution, Public health, Market value.
Identifiers: *Social cost, *Social benefit, External economies, Neoclassical economics, Alfred Marshal, W Michalski, Public investment, Pigou, Christian Uhlig, Myrdal.

LIBRARY U. OF I. URBANA-CHAMPAIGN

This paper discusses the challenging difficulties to economic analysis presented by the problem of social cost. It remains doubtful whether these difficulties can be coped with adequately within the traditional boundaries of economic science. Neither the theory of resource allocation nor applied economics seem to provide adequate categories for the theoretical treatment of social costs or practical guidelines for their control. The concept of social costs, itself, was developed as an analytical instrument and as a critique of the method and scope of classical and neoclassical economic analysis. Social costs refer to consequences of productive activities and policy decisions which, for several reasons, carry an inevitable residuum of indeterminacy but which are nevertheless real and important, even though their approximate magnitude can be determined only after careful study which in many instances call for an evaluation based upon criteria other than market values. The author suggests wider concepts of social costs and social benefits than those that emerge from an attempt to incorporate these notions into traditional theory. Social costs are closely involved with water pollution problems and as such this article presents a general treatment of the economic basis of the social cost concept for the water researcher. OPTIMAL SUBSIDIES AND TAXES WHEN SOME FACTORS ARE TRADED,
Massachusetts Inst. of Tech., Cambridge; Indian Ministry of Finance; Stanford Univ., Palo Alto, Calif.; and Indian Statistical Inst., New Delhi.
U. K. Ramaswami, and T. N. Srinivasan.
Jour Pol Econ, Vol 76, No 4, pt 1, pp 569-582, July/August 1968. 14 p, 2 fig, 10 ref, 2 append.

Descriptors: *Tariff, Welfare, Wages, Constraints.
Identifiers: *Optimal policies, *Revenue, Trade taxes, Consumption tax, Intermediate goods, Production function, Utility function, Subsidies, Outout diversification.

Trade taxes would secure revenue without welfare loss, instead of a uniform consumption tax, if factor supplies are inelastic. It is often not feasible, particularly in underdeveloped countries, to tax the consumption of much of home output. It is, therefore, of practical importance to determine the optimal policies for collecting specified revenue through trade taxes. It is shown in this paper that inputs used in export production must be free of duty in the second-best revenue tariff. It is also shown that optimal revenue duties on imports for home use will in general not be uniform. This does not, of course, mean that complex tariffs in the real world, which have been framed largely in response to pressures of interested groups, are optimal. What the conclusion suggests is that revenue tariffs should be based on objective empirical research. This conclusion could be applied to tariffs or fees on water traded interregionally or internationally whose main purpose was the raising of additional revenue. (Sokoloff-Rutgers)

THE INTERPRETATION OF VOTING IN THE ALLOCATION OF ECONOMIC RESOURCES,
Grinnell Coll., Iowa.
Howard R. Bowen.
Quarterly Journal of Economics, Vol 58, No 4, pp 27-48, November 1964. 22 p, 6 fig, 1 tab.

Descriptors: *Social needs, *Distribution patterns, *Costs, *Cost-sharing, Taxes, Education.
Identifiers: *Social goods, *Individual goods, *Ideal output, *Voting, Quantitative measurement, Marginal rate of substitution, Consumer choice.

The article begins with a comparison of individual goods with social goods. The bulk of economic thought has been devoted to individual goods. The author is attempting to show how certain portions of conventional economic theory may be adapted to problems relating to the production of social goods. The article proceeds to a formulation of the basic principles to guide the production of social goods, the application of these principles and the examination of problems in the distribution of costs. Thus, the alternatives for quantitative measurement of social goods are explained as well as the means for determining the ideal output of social goods. Voting in terms of a substitute for consumer choice in determining what social goods are to be provided and in what quantities, is discussed. The article concludes with a discussion of the problems of distributing social goods and their unequal benefits. Since water resources have public good components the problems discussed here have relevance to the water resource planner. (Murphy-Rutgers)

DECOMPOSITION, PRICING FOR DECENTRALIZATION AND EXTERNAL ECONOMIES,
Princeton Univ., N. J.; and Mathematica, Princeton, N. J.
W. J. Baumol, and T. Fabian.
Management Science, Vol 11, No 1, pp 1-31, September 1964. 32 p, 4 fig, 1 tab, 13 ref.

Descriptors: Linear programming, *Optimization, Constraints, Profit.
Identifiers: *Decomposition method, External economies, External diseconomies, Marginal yield, Multipliers, Decentralization, Dual prices.

The decomposition procedure for the solution of large scale linear programs is described in an elementary manner with illustrative calculations. Its economic interpretation as a procedure for decentralized decision by the multi-division firm or the multi-sector economy is explained in detail. Decomposition is shown to provide internal prices for decentralized decision making in the presence of external economies or diseconomies. However, it is demonstrated that in many cases there exist no prices which will lead divisions to make independent decisions that are optimal from the point of view of the company or economy as a whole. Of particular interest to the water resource researcher is the explanation provided of the way in which penalties and bonuses can be calculated and imposed to modify the price system in dealing with external economies and diseconomies. (Murphy-Rutgers)

MARGINAL COST PRICING IN PRACTICE,
Amherst Coll., Mass.
J. R. Nelson.
Englewood Cliffs, N. J., Prentice-Hall Inc, 1964. 266 p.

Descriptors: *Marginal costs, *Tariff, *Uncertainty, *Inflation, *Investment, Financing, Prices, Operating costs, Capital costs, Interest rates, Resource allocation, Budgeting.
Identifiers: *Marginal cost pricing, *Rate structures, *Cost dimensions, *Elasticity of demand, *Financial constraints, Decreasing costs, Increasing costs.

The book is a collection of translations of various French journal articles dealing with marginal cost pricing in the public utilities sector. The application of these pricing concepts is particularly useful in the water resource area. The first chapter provides a summary of the research conclusions of the basic tariff studies of Electricite de France as well as suggestions for future research and practical application. Chapter two provides an introduction into the principles of rate-fixing. Chapters three through six seek to define marginal cost and give demonstrations of how marginal cost is a function of demand. Following a discussion of load factor problems and the importance of time there is a chapter dealing with costs and prices based on uncertainty. Later chapters describe the application of the theory through the use of tariffs. A chapter is devoted to the complexities of water power. The final chapters discuss problems of pricing with given cost structures and cost minimization with maximum economy of operating and capital costs. This book provides for the water researcher a useful survey and treatment of both theoretical and applied issues in marginal cost pricing. (Murphy-Rutgers)

THE PROBLEM OF SOCIAL COST,
Virginia Univ., Charlottesville.
R. H. Coase.
The Journal of Law and Economics, Vol 3, No 4, pp 1-14, October 1960. 15 p.

Descriptors: *Cost sharing, *Pricing, *Government supports, *Welfare economics, Damages, Industrial production.
Identifiers: *Social costs, *Rights, Liability, Market transactions, Private product, Social product.

This paper is concerned with those actions of business firms which have harmful effects on others. The problem is how to avoid serious harm to any member of the community. This is the problem, for example, faced by the water resource planner in attempting to control the undesirable effects of commercial water usage or water development. The author discusses the role of the pricing system with and without liability for damage. The author attempts to take the cost of market transactions into account when considering a solution to the problem. A large section is devoted to Pigou's treatment of the problem with the conclusion that his position is somewhat unsatisfactory. Thus, the author concludes that the traditional approach based on this analysis is faulty and proposes a change which will consider the total effect of an economic action. (Murphy-Rutgers)

INTEGER PROGRAMMING AND PRICING,
Thomas J. Watson Research Center, Yorktown Heights, N. Y.; and Princeton Univ., N. J.
Ralph E. Gomory, and William J. Baumol.
Econometrica, Vol 28, No 3, pp 521-550, July 1960. 30 p, 9 fig, 6 tab, 13 ref, 2 append.

Descriptors: *Pricing, Linear programming, Fixed costs, Costs, Resource allocation, Constraints, Competition.
Identifiers: *Integer programming, *Method of integer forms, Dual prices, Shadow prices, Input, Output, Simplex method, Marginal valuation, Free good.

The method of integer forms (MIF) for solving integer programming problems is described. The paper discusses the pricing problem in the integer programming case--the case where, in economic terms, the inputs and outputs are not perfectly divisible. It is shown that the MIF algorithm produces a dual problem whose solution also inputs shadow prices to the scarce inputs. These prices possess a number of the properties of the dual prices of ordinary linear programming. In particular, they possess one of the most important properties of ordinary dual prices, that is, they permit the construction of a decentralized decision making arrangement which, in principle, will achieve some of the possible efficient allocations of resources. However, the price system no longer suffices to achieve every efficient allocation and when the consumer side of the market is taken into account the entire ideal output theorem of perfect competition runs into difficulties. Integer programming techniques have proven to be quite helpful in water research problems both in engineering and economic applications. This article in apply techniques to situations where inputs and outputs are indivisible has potential applications to the water resource area where this condition is constantly present. 6D. Water Demand

SOCIOECONOMIC FACTORS AFFECTING PARTICIPATION IN WATER-ORIENTED OUTDOOR RECREATION,
Missouri Agricultural Experiment Station, Columbia. Dept. of Agricultural Economics.
Durward Brewer, and Glenn A. Gillespie.
ERS-403, U.S.D.A. Econ. Res. Serv., Missouri Exp. Station, April 1969. 37 p, 25 tab, 3 fig, 1 append, 19 ref.

Descriptors: *Survey, Statistical methods, *Recreation demand, Recreation facilities.
Identifiers: *Socioeconomic characteristics, Analysis of variance, Duncan's test.

Socioeconomic characteristics can be used by public planners and private investors to estimate demand for water-oriented recreation. Important socioeconomic characteristics are annual family income, education, sex, race, age, occupation, and leisure time. About 67 percent of the families interviewed participated in water-oriented recreation. Through statistical analysis the affect of each socioeconomic characteristic on water-oriented recreation was measured. An appendix and a selected bibliography are included. (Grossman-Rutgers)
W69-06844

AN ECONOMETRIC MODEL FOR PREDICTING WATER-ORIENTED OUTDOOR RECREATION DEMAND,
Missouri Agricultural Experiment Station, Columbia. Dept. of Agricultural Economics.
Glenn A. Gillespie.
ERS-402, U.S.D.A. Econ. Res. Serv. Missouri Exp. Station, March 1969. 15p, 3 tab, 1 append, 1 bib, 5 ref.

Descriptors: *Demand, *Survey, Regression analysis, *Recreation demand.
Identifiers: *Socio-economic characteristics, *Econometric model.

The econometric model analyzes socio-economic characteristics associated with water-oriented outdoor recreation activities of people: annual family income, education, sex, race, age, and occupation. The information was obtained from interviews with 1,000 families in the St. Louis, Missouri area. The model makes possible estimations of future demand. However, the parameters may be different in other areas, and the parameters may change over time. The parameters will have to be re-assessed under these different conditions. (Grossman-Rutgers)

THE ECONOMIC SIGNIFICANCE OF COLUMBIA BASIN PROJECT DEVELOPMENT,
Bureau of Reclamation, Vancouver, Wash. Columbia Basin Project Office.
A. L. Walker, B. D. Parrish, H. O. Ward, O. L. Adams, and O. L. Brough, Jr.
Washington Agr. Exp. Sta., Coll. of Agr., Washington State Univ., Bulletin 669, Sept. 1966. 62 p, 12 map, 13 photo, 38 fig, 63 tab, 2 append, 6 ref.

Descriptors: *Columbia River Basin, *Economic impact, *Irrigation effects, Grand Coulee Dam, Dry farming, Land use.

The Columbia Basin Project is a multiple purpose development of water resources. The methodology used is to compare the economic growth in the Columbia Basin Project area with a non-irrigated dryland farming area which is similar to the project area except for irrigation. The report includes a description of the areas studied: natural resources, history, and project facilities. To determine the economic impact of the project the study examined the development of farm resources, the effects of agricultural development on non-farm economic activities, population, business and employment, postal receipts, consumption of electricity, telephone service, property values, tax receipts, public services, and complementary contributions from the Grand Coulee Power Plant and other areas. The report includes much statistical information, graphs, and two appendices. (Grossman-Rutgers)
W69-06848

WATER RESOURCES OF NORTH CAROLINA: BROAD AND CATAWBA RIVER BASINS.
North Carolina State Dept. of Conservation and Development. Div. of Water Resources, Inlets and Coastal Waterways.

Division of Water Resources, Inlets and Coastal Waterways, Volume VIII of XII volumes containing information regarding water resources of North Carolina, Raleigh, 1958. 138 pp, 320 tab.

Descriptors: *North Carolina, *Water resources, Municipal water, Agriculture, Industrial water, Water users, Electric power industry, Recreational facilities, Chemical properties, Water supply, Groundwater, Surface waters, Irrigation permits, Wells, Legislation, Streamflow, Water quality, Soil conservation, Navigation, Floods, Streams, Tributaries, Topography, Geology, Forest soils, Climatic data, Human population, Lumbering, Mining, Transportation, Mapping.
Identifiers: County governments, Muddy Creek Watershed Project.

The report describes the North Carolina watershed, including main streams, principle tributaries, topography, geology, forest cover, climate, population, industry, agriculture, lumbering, mining, transportation, mapping, watershed boundaries, and general information regarding counties. Chapters two-five discuss use of water for: domestic and municipal purposes; agriculture; industry; and, electric power and recreation. These discussions include descriptions and chemical character of public surface and ground water supplies in each county; data regarding agricultural production; a listing of irrigation permits; records of wells that supply water for industries; House Document No. 96, 73rd Congress, 1st session; generation of power by the Duke Power Co.; and a listing of recreational facilities. The sixth chapter gives streamflow records for fourteen locations. The seventh discusses the groundwater supply of the Statesville and Charlotte areas. Chapter Eight discusses quality of public water supplies and chemical character of surface waters at eighty-three locations. Chapter nine states stream sanitation policy and the powers and action of the State Stream Sanitation Committee. Chapter ten discusses soil conservation practices, the Muddy Creek Watershed Project, and its work plan. Chapter eleven discusses existing navigation projects; floods of July 1916, August 1928 and October 1929; and flood control in the Santee River Basin. (Gossen-Chicago)

RESEARCH ON RECREATIONAL USE OF WATERSHEDS AND RESERVOIRS,
Public Health Service, Cincinnati, Ohio. Div. of Criteria and Standards.
J. Keith Carswell, James M. Symons, and Gordon G. Robeck.
J Amer Water Works Ass, Vol 61, No 6, pp 297-304, June 1969. 8 p, 5 fig, 2 tab, 13 ref.

Descriptors: *Water supply, *Recreation, *Reservoirs, Multiple-purpose projects, Aesthetics, Water quality, Behavior, Lakes, Psychological aspects, Public health, Recreation demand, Reservoir operation.
Identifiers: Reservoir use.

Studies of the effects of recreational use of watersheds and reservoirs on water quality and the question of whether such use should be permitted are reviewed. Although it is common practice to ban recreational use, several recent studies show that properly regulated recreation has no deleterious effects. Other studies show rather severe recreational pollution, most of which seems to be caused by lack of cooperation with the reservoir management, littering, unsanitary habits, and willful destruction and fouling. It is concluded that recreation need not be prohibited in many water-supply reservoirs, depending on local feelings, costs, and public willingness to obey sanitary regulations. (Knapp-USGS)

ANALYTICAL ISSUES IN DEMAND ANALYSIS FOR OUTDOOR RECREATION,
Oregon State Univ., Corvallis.
Herbert H. Stoevener, and William G. Brown.
Journal of Farm Economics, Vol 49, No 5, pp 1295-1304, December 1967. 10 p, 2 fig, 1 tab, 12 ref.

Descriptors: *Recreation, Estimating, Demand, Welfare, Income, Marginal utility.
Identifiers: *Policy issues, *Research problems, Quantitative estimates, Option demand, Opportunity demand, Consumer surplus, Willingness to pay.

The current interest in analytical issues of evaluating the demand for outdoor recreation stems both from the need for policy guidance in this important area of resource allocation and from the recent

LIBRARY U. OF I., URBANA CHAMPAIGN

quantitative work in estimating demand functions for outdoor recreational services. In this paper the authors attempt the following: First, they address themselves to a set of arguments which challenge fundamentally the idea of quantifying the demand for outdoor recreation. Second, they direct attention to some areas in which additional work appears to be necessary, if the general framework of economic analysis is accepted. They raise some analytical issues which appear to be relevant from a policy viewpoint. Some available empirical results are presented. The importance of water facilities in outdoor recreation make this article relevant to water resources research. (Loeb-Rutgers)

DISCUSSION: ANALYTICAL ISSUES IN DEMAND ANALYSIS FOR OUTDOOR RECREATION,
Utah State Univ., Logan.
B. Delworth Gardner.
Journal of Farm Economics, Vol 49, No 5, pp 1304-1306, December 1967. 3 p.

Descriptors: *Demand, *Recreation, Demand schedule, Resource allocation, Marginal utility, Welfare, Statistical methods, Costs, Pricing.
Identifiers: *Demand analysis, Price system.

This paper discusses the previous paper by Stoevener and Brown. In the study of outdoor recreation, economists have seemingly divided themselves into two camps. In the first group are those who believe that the price system should be used, directly or indirectly, in allocating resources to outdoor recreation. This group does not unanimously favor the imposition of use fees but does believe that at least surrogate prices should be estimated to guide resource commitments to recreation. The second group argues that, for various reasons, economics has little to contribute in this area. Recreation prices should be zero and the resource allocation decisions should be settled by political means. The author feels that Stoevener and Brown belong to the first group. Their paper is an attempt to answer some of the more serious objections of the 'detractors' of economics. Failure to use large doses of economics in allocating resources to outdoor recreation makes it impossible to detect bad management and gross inefficiency. The economic criteria used to assign benefit values to water oriented outdoor recreation has important impacts on the cost justification of many water projects. Accordingly, this article is relevant to water recreation planners in its argument for improving the economic framework of recreation pricing. (Loeb-Rutgers)

6E. Water Law and Institutions

URBAN ENVIRONMENTAL PROBLEMS: ROLE OF THE FEDERAL GOVERNMENT,
Florida Univ., Gainesville. Water Resources Research Center.
Fletcher N. Baldwin.
Engineering Progress, University of Florida, Vol XXI, No 6, Bulletin No 128, pp 19-51, June 1967. 31 p, 173 ref.

Descriptors: *Federal jurisdiction, *Water law, Judicial decisions, Water rights, Federal-state water rights conflicts, Federal project policy, Riparian rights, State jurisdiction, History, Navigation, Florida, Water supply.
Identifiers: Federal constitution, Commerce Clause.

There are sufficient constitutional provisions and U.S. Supreme Court decisions to allow the federal government to establish a national policy of water regulation and control, and water law is slowly moving in that direction. Major discussion topics include: national policy and water rights in Florida and in the east, where water is still abundant; a history of federal water regulation; federal constitutional power; Supreme Court interpretation of the Commerce Clause; the first and second tests of navigability; the elimination of any opportunity for states to negate federal jurisdiction by compact with another state; initial effect of the Commerce Clause upon nonnavigable streams; limitation upon state and private water rights; extension of federal authority into nonnavigable waters; dominant federal servitude along navigable and nonnavigable waters; limitation upon federal 'taking'; and, the present status of the riparian owner in relation to federal projects on navigable and nonnavigable streams. In conclusion, the Supreme Court will have final say in interpreting federal water rights. It is probable that distinctions between navigable and nonnavigable streams will be practically eliminated. The water conflict is a dilemma that involves basic ideas of states' rights as opposed to national interests. (Gossen-Chicago)

MALICIOUS INJURY TO AND DESTRUCTION OF PROPERTY.

N Y Penal Law secs 1425.8, 1425.12 (McKinney 1968).

Descriptors: *New York, *Oysters, *Lakes, *Poisons, Legislation, Shellfish, Damage, Rivers, Bay, Sound, Buoys, Boats, Beds, Ponds, Fish.
Identifiers: Piscivorous fish, Penalties (Criminal).

It is a misdemeanor to disturb an oyster or shellfish bed which is legally planted in any waters of the state or to destroy a stake or buoy designating the bed. A bed is legally planted when it is planted under the authority of the state or under a lease made with any town or city. A bed is legally marked when the owner can show that one or more stakes were placed at the corner of the bed at least 90 days before the offense was committed. Evidence showing that any boat or vessel was used to carry away oysters shall create a presumption of guilt against the owner, master, or crew of the vessel. It is unlawful to take, or attempt to take, without consent of the owner, any fish from a lake or pond that is situated so that the fish could not pass into it from any other body of water. It is unlawful to place any piscivorous fish or poisonous substance injurious to the health of the fish in any lake or pond without the consent of the owner. It is unlawful to let water out of a lake with the intent to take or harm the fish located therein. (Shevin-Fla)

DELAWARE RIVER BASIN WATER COMM'N COMPACT.

N Y Unconsolidated Laws secs 1581-1584 (McKinney Supp 1968).

Descriptors: *New York, *Delaware River Basin Comm'n, *State governments, *Interstate compacts, New Jersey, Pennsylvania, Delaware River, Streams, Surface waters, Dams, Reservoirs, Impounded waters, Riparian rights, Riparian lands, Eminent domain, Condemnation, Legislation, Water conservation, Water demand, Water resources development, Water supply, Water distribution (Applied), Public benefits, Legal aspects, Competing uses.

The Delaware River Basin Water Commission is comprised of three Commissioners, each appointed by the governor of his respective state. The federal government may be represented on the Commission by three advisory members. No action taken at any meeting of the Commission shall have force and effect until the governors of the signatory states are afforded an opportunity to approve or veto such action. The Commission is invested with all the rights and obligations inherent in natural persons and corporations for the effectuation of its authorized purposes. The Commission may acquire property within the Delaware Basin by eminent domain and condemnation proceedings. A signatory state's consent to the acquisition, occupation, and use of real property within its borders for maintenance of dams, reservoirs and related structures is required. The Commission is prohibited from transmitting hydroelectric power except for its own use. The Commission's activities may be financed by loans from the signatory states and by the issuance of negotiable bonds. The Commission shall endeavor to provide a common water supply and shall regulate such supply on the basis of equitable apportionment. (Katz-Fla)

DRAINAGE AND RECLAMATION OF LANDS.
N J Stat Ann secs 40:57-1 to 40:57-11 (1967).

Descriptors: *New Jersey, *Drainage districts, *Land reclamation, *Federal project policy, Federal government, Local governments, Administrative agencies, Drainage programs, Drainage systems, Dredging, Landfills, Cost allocation, Cost sharing, Taxes, Financing, Assessments, Maps, Cities, Riparian land, Swamps.

Chapter 57 of the New Jersey Statutes, entitled Drainage and Reclamation of Lands, consists of eleven subsections. Section one deals with the creation of municipal districts for reclamation and improvement of lands and with federal cooperation in that effort. Section two deals with cost allocation regarding such improvements and the duties of the State Board of Commerce and Navigation in furnishing a report and map. Section three concerns various procedural prerequisites the municipality must follow pursuant to obtaining federal assistance. Section four deals with the proceedings required upon failure of a municipality to join in such a proposed joint project. Section five enables dredged materials to be used as fill and authorizes the necessary entrance upon the lands to be improved. Section six concerns the financial and budgetary duties of a municipality in carrying out a project. Section seven concerns the application of receipts from assessments and the use of a tax levy or a bond issue if assessments prove insufficient. Section eight concerns the mode of municipal assessments of the lands benefited by these projects. Section nine deals with municipal assessments of riparian or submerged lands benefited. Section ten deals with the drainage of swamps and meadows. Section eleven establishes proceedings whereby small landowners may drain and improve their lands. (Carruthers-Fla)

FINDLEY LAKE PROPERTY OWNERS, INC V TOWN OF MINA (COMPETING USES).
154 NYS 2d 775-809 (Sup Ct 1956).

Descriptors: *New York, *Lakes, *Dams, *Proprietary power, Prescriptive rights, Reasonable use, Competing uses, Riparian rights, Riparian lands, Reservoir operation, Hydraulic structures, Mill dams, Streams, Aquatic weeds, Prior appropriation, Judicial decisions, Legal aspects, Remedies, Water level fluctuation, Water level, Water wells, Cities, Real property, Land tenure.
Identifiers: Injunctions (Prohibitory).

Plaintiff brought this action to evict a town board from certain premises and to permanently enjoin the board from constructing and maintaining gates at the plaintiff's damsite. The board contended that plaintiff's lowering of the lake level to make dam repairs and its poisoning of aquatic weeds threatened the recreational use of the lake, resulted in an unhealthful condition, and constituted a public nuisance. The court determined that the existence of a public nuisance was not proved beyond a reasonable doubt, as required by law, and held that the board's seizure of the dam site was not an abatement but a trespass. The board contended that the plaintiff's predecessors in title to the dam owned the right to use the impounded water only for generating power and that plaintiff's use of the dam for purposes of water level control was beyond the scope of the interest acquired. The court found an inherent inconsistency in the terms of the deed which justified consideration of the intent of the parties thereto. The court held that the parties intended the plaintiff to receive the right to use the impounded water for lake level control. (Katz-Fla)
W69-06873

RIVER DEVELOPMENT CORP V THE LIBERTY CORP (OWNERSHIP BELOW THE HIGH WATER MARK, LAND RECLAMATION).

45 N J Super 445, 133 A 2d 373-389 (1957).

Descriptors: *New Jersey, *Ownership of beds, *Boundaries (Property), *Patents, Leases, Proprietary power, Contracts, Tidal waters, High water mark, Low water mark, Submerged lands act, Dredging, Landfills, Riparian rights, Riparian lands, Land reclamation, Land tenure, Legislation, Legal aspects, Judicial decisions.
Identifiers: United Companies Act, General Riparian Act, Injunctions (Prohibitory).

The plaintiff sought to enjoin defendant from conducting dredging operations in certain tidal waters which plaintiff claimed to own. The plaintiff's claim was based on the United Companies Act which, plaintiff contended, granted the tidal land in question to his predecessors in title. The defendant contended that the Act merely vested plaintiff with a revocable license and was not a grant in fee. The defendant further contended that the state had revoked the license and had granted to defendant the privilege to conduct dredging operations. The court examined the Companies Act in pari materia with the General Riparian Act passed the same day. The court concluded that the Companies Act created a revocable right in the plaintiff to reclaim the lands in question but found that right had been revoked by the General Riparian Act and subsequent legislation. Public policy required that title to land beyond the high water mark be vested in the state. (Katz-Fla)

FAXON LAND CO V LAUBACH (SUIT TO ENJOIN BROUGHT AGAINST WRONG PARTY).

5 Lycoming 169, 7 D and C 32-34 (C P Lycoming County Pa 1956).

Descriptors: *Pennsylvania, *Jurisdiction, *Pipes, *Contracts, Road construction, Drainage systems, Legal aspects, Judicial decisions, Conduits, Surface runoff, Surface drainage, Damages, Maintenance.
Identifiers: Indispensible party, Trespass, Independent contractor.

Plaintiff sought to enjoin maintenance of a drain pipe which cast water upon his property. The defendant in this action was a contractor who constructed the pipe pursuant to contractual arrangements between himself and the Pennsylvania Department of Highways. The work was done at the direction and under the supervision of the Secretary of Highways. The court dismissed the bill on jurisdictional grounds, finding that the action should have been commenced in Dauphin County and that the Commonwealth was the proper party defendant. (Logan-Fla)
W69-06875

EMINENT DOMAIN - TAKING OR INJURY OF PROPERTY AS GROUNDS FOR COMPENSATION - NAVIGATIONAL SERVITUDE,
H. R. Weinberg.
Case W Res L Rev, Vol 19, No 4, pp 1116-1123, June 1968. 8 p, 45 ref.

Descriptors: *Riparian rights, *Eminent domain, *Condemnation, Appropriation, Federal government, Riparian land, State governments, Relative rights, Damages, Navigable waters, Judicial decisions, Legal aspects, California.
Identifiers: Navigational servitudes, Compensation.

The recent cases of United States v Rands, 389 U S 121 (1967) and Colberg, Inc v State, 432 P 2d 3, 62 Cal Rptr 401 (1967) deal with the navigational servitude. This servitude may be defined as the federal privilege to take private property without compensation because the taking is a result of the lawful exercise of a power to which private interests have always been subject. These cases extended the federal and state power to make any value in riparian land arising from the land's proximity to a navigable body of water subject to its exercise. In the future, it is unlikely that the U S Supreme Court will draw nice distinctions between various values in riparian land which arise from the flow of a stream. Under these decisions the courts may have extended the doctrine of the navigational servitude too far. They still have not articulated convincing or well-founded reasons to justify continued adherence to this principle. (Heckerling-Fla)
W69-06876

WHEATLEY V CASS COUNTY (ACTION TO PREVENT CONSTRUCTION OF DRAINAGE CULVERT UNDER HIGHWAY).

31 NW 2d 871-875 (Iowa 1948).

Descriptors: *Iowa, *Drainage systems, *Surface drainage, *Culverts, Relative rights, Judicial decisions, Easements, Channels, Surface runoff, Surface waters, Drainage water, Grading, Water law, Public benefits, Overlying proprietors, Local governments, Legal aspects.
Identifiers: Injunctions (Prohibitory).

Plaintiffs sued to enjoin the county supervisors from constructing a culvert under a highway at an existing channel location. Such a culvert, if installed, would alter the flow of surface water. The issue was whether the doctrine of equitable estoppel would apply in this case to justify prevention of the planned installation. Plaintiffs contended that they purchased their land after the grade and drainage system along the highway had been established and that, believing that no further construction would be undertaken thereon, erected valuable improvements which would be destroyed if the culvert was established. All parties recognized the right of defendant, as dominant owner, to discharge drainage water into a natural watercourse upon its land. However, there is no right to discharge water upon the servient estate in largely increased quantities, or at a different place or in a different manner than through the natural course of drainage. The appellate court affirmed the lower court's decision in favor of the county. The court held that plaintiff had failed to prove the necessary elements of reasonable reliance, deception and change of position. Plaintiff had also failed to show that material damage would result from the contemplated course of action. (Wheeler-Fla)
W69-06877

HUNT V SMITH (DAMAGE BY OBSTRUCTION TO NATURAL FLOW).

28 NW 2d 213-223 (Iowa 1947).

Descriptors: *Iowa, *Surface waters, *Watercourses, *Obstruction to flow, Surface drainage, Riparian rights, Legal aspects, Judicial decisions, Surface runoff, Floods, Rain water, Levees, Natural flow, Streams, Flood control, Repulsion (Legal aspects), Overflow, Dams, Riddance (Legal aspects).
Identifiers: *Swales, Des Moines River.

Plaintiff sought to restrain defendant from constructing a dam on his land which would obstruct the natural flow of water and cause it to back up on plaintiff's land. The defendant contended that he had an absolute right to repel surface waters. The court distinguished surface waters from watercourses which flow in a definite channel. The court further stated that the swale which defendant had dammed was a watercourse. A swale or depression through which surface water runs is a watercourse even though such depression or swale has no defined banks. The defendant had no right to obstruct the natural flow. When water flows in a well-defined course, its flow cannot be arrested or interfered with by the landowner to the injury of the neighboring proprietors. (Shevin-Fla)
W69-06878

AMORY V COMMONWEALTH (DAMAGES FOR DIVERSION).

72 NE 2d 549-561 (Mass 1947).

LIBRARY OF THE URBANA CHAMPAIGN

Descriptors: *Massachusetts, *Riparian rights, *Reservoir construction, *Eminent domain, Dams, Flood control, Legal aspects, Judicial decisions, Navigable streams, Rivers, Reasonable use, Federal government, Public benefits, Water supply, Diversion dams, Reservoirs, Hydroelectric plants, Flood damage, Benefits.
Identifiers: Measure of damages.

Plaintiff sought an assessment of damages against the State of Massachusetts for the taking and diversion of certain water in connection with the construction of a reservoir. In determining damages where no land has been taken, the benefits accruing to the land because of the diversion of water may be taken into account; however, in order to offset damages, a benefit must be shown to have accrued directly to the land by virtue of the public improvement. Since plaintiff's land was so situated that it was unlikely that the flood control benefits provided would accrue to it, no deduction from damages was allowable. The loss sustained by other similarly situated property owners could be used as a guide in assessing the amount of loss sustained by plaintiff. (Shevin-Fla)
W69-06879

JOINT COMMISSIONS FOR ALLEVIATION OF FLOOD CONDITIONS.

N J Stat Ann secs 40:69-51 to 40:69-10 (1967).

Descriptors: *New Jersey, *Legislation, *Administrative agencies, *Flood control, Civil engineering, Cities, Local governments, Financing, Legal aspects, Regulation, Floods.

Any two or more municipalities may establish, by ordinance, a joint municipal commission for the alleviation of flood conditions. The composition of such commission shall be 5 or more members, two appointed by the governing body of each municipality and one by the governor. All will serve for 5 years. The commissioners shall serve without compensation; only their expenses shall be paid. The powers of the commission are: (1) to employ all necessary clerical assistants, agents, workmen, and servants as necessary; (2) to determine the duties and compensation of employees; (3) to engage the services of competent engineering firms; and (4) to do all other acts necessary to alleviate flood conditions and to prevent floods. Municipalities may authorize appropriations for the use of the commission. The commission may expend funds appropriated to it in order to effectuate the purposes of this act. (Heckerling-Fla)

POWERS TO BE EXERCISED BY GOVERNING BODY OF MUNICIPALITY.
N J Stat Ann secs 40:69-4.7 to 40:69-4.12 (1967).

Descriptors: *New Jersey, *Legislation, *Cities, *Financing, Real property, Eminent domain, Condemnation, Operation and maintenance, Repairing, Legal aspects, Contracts, Local governments, Electric power.
Identifiers: Encumbrances, Bonds.

Any municipality having made an acquisition of real property as specified in this chapter may have full use and enjoyment of such property and may construct, erect, repair, and operate the same to the extent authorized in section 6 (a). It may also purchase electric current from outside sources. Any power conferred by this chapter on a municipality shall be exervised by its governing body, which body may act without a public referendum. Acquisition of property by eminent domain or condemnation is not authorized. Negotiable bonds and notes may be issued to finance the acquisition of property covered by this act. Section 4.11 makes the power to issue bonds and notes independent of the power to acquire property or to discharge encumbrances or claims thereon, nor will it be effected by the validity or regularity of the proceedings therefor, or the authorization therefor, or the cinancing transactions out of which such bonds or notes arise. Section 4.12 makes each section of this act independent and unaffected by the invalidity of any other section. (Heckerling-Fla)
W69-06881

RIGHTS ACQUIRED BY MUNICIPALITY IN RIPARIAN LAND.

N J Stat Ann sec 40:69-46 (1967).

Descriptors: *New Jersey, *Legislation, *Riparian rights, Cities, Local governments, Utilities, Public benefits, Water resources development, Contracts, Leases, Electric power, Electric power production, Power marketing, Legal aspects, Operation and maintenance.

In regard to property or other rights acquired under the provisions of this chapter, any municipality may: (a) make use of such property and rights, and sell or furnish water, electric current, etc to any public utility in the state, or to tenants of or in the immediate vicinity of the municipality; (b) enter into contracts with any public utility or any other person for the use and operation of such rights and property; (c) lease such rights and property to any public utility company or to any other person or persons; (d) sell so much of such rights and property which the municipality may find or determine are not needed by the municipality for a public purpose; (e) exercise, in whole or in part any and all of the alternative powers and privileges herein specified with respect to the said property and rights, or any part thereof. Any contract or lease may contain such terms as the governing body of the municipality deems proper and in the public interest, and such agreement shall run for a period not exceeding 50 years. (Heckerling-Fla)

MUNICIPAL ACQUISITION OF WATER RIGHTS.
N J Stat Ann secs 40:69-4.1 to 40:69-4.5 (1967).

Descriptors: *New Jersey, *Legislation, *Water rights, *Local governments, Cities, Riparian rights, Navigable waters, Nonnavigable waters, Legal aspects, Financing, Contracts, Conservation.
Identifiers: Encumbrances.

Section 4.1 defines the following terms: governing body, water rights, water power, water power rights, and water power property. Any municipality may acquire real property having appurtenant thereto riparian rights, 'water rights,' 'water power,' 'water powerrights,' and 'water power property,' together with real and personal property relating thereto. Title to land acquired in this manner shall pass to and vest in the municipality in as full and ample manner as the same was theretofore held and enjoyed by the person or persons owning the same. The above described acquisition may be made for such sum or sums, and upon such terms, covenants, and conditions, as may be agreed upon, and the property may be acquired subject to leases, mortgages, liens, and other claims, which may be performed or discharged by the municipality. The municipality may hold and retain so much of the said property so acquired as may be necessary for the conservation, regulation, use, or enjoyment of such real property. Property not needed for public use may be sold, leased, or otherwise disposed of. (Heckerling-Fla)
W69-06883

IMPROVEMENT OF CHANNELS IN NAVIGABLE WATERS.

N J Stat Ann secs 40:69-3, 40:69-4 (1967).

Descriptors: *New Jersey, *Legislation, *Navigable waters, *Channel improvement, Cities, Taxes, Local governments, Financing, Legal aspects, Cost allocation, Cost sharing, Contracts.

Any municipality bordering on a navigable stream may expend moneys for deepening or widening the channel of such stream. These moneys may be raised by taxation or by the sale of bonds. Any municipality may enter into an agreement with any other municipality bordering upon a navigable stream, or with the board of chosen freeholders of the county in which such municipalities are situated, or both, for the joint expenditure of such sums of money as may be necessary to accomplish the purposes provided for in section 40:69-3 of this title. The cost of carrying out these programs may be divided between the municipalities and the county in such proportions as may be agreed upon between them. (Heckerling-Fla)
W69-06884

ELIMINATION OF NATURAL BROOKS.
N J Stat Ann secs 40:69-1, 40:69-2 (1967).

Descriptors: *New Jersey, *Legislation, *Natural streams, *Financing, Local governments, Administrative agencies, Community development, Cities, Obstruction to flow, Drains, Legal aspects, Bridges, Culverts.

The governing body of a municipality may cover any natural stream or watercourse running through it and may change the alignment or course of such stream provided the water of such stream or watercourse is properly cared for and disposed of by a drain or drainage system. Whenever any such stream or watercourse crosses a public road over which the county would be obliged by law to build a bridge or culvert and the improvement o such stream or watercourse will render such bridge or culvert unnecessary, the county may contribute to the municipality such proportion of the cost of the improvement as it shall consider fair, after approval of the improvement plans by the board of freeholders. However, th improvements shall be done by the municipality. Bonds or notes may be issued to pay for the improvements. (Heckerling-Fla)
W69-06885

WATER AND WATERCOURSES.
N J Stat Ann secs 40:69-1 to 40:69-10 (1967).

Descriptors: *New Jersey, *Legislation, *Watercourses (Legal), *Cities, Administrative agencies, Natural streams, Local governments, Water rights, Riparian rights, Utilities, Community development, Public benefits, Water resources development, Eminent domain, Taxes, Costs, Drainage systems, Lease, Contracts, Flood control, Civil engineering, Navigable waters, Channel improvement, Legal aspects, Financing.

These sections pertain to the waters and watercourses within municipalities and permit: (1) the elimination of the natural brooks or a change of their course; (2) the cost of such improvement to be shared in by the county; (3) municipalities to improve channels in navigable waters; (4) joint municipal and county action to improve channels; (5) municipalities to acquire water rights; (6) disposition of property not needed; (7) and maintenance and repair of water power sources and purchase of supplementary power. These sections also give municipalities governing power with regard to properties acquired and permit the issuance of certain bonds. These sections also provide for the establishment of joint municipal commissions for the alleviation of flood conditions and sanction appropriation of funds to the commission to carry out their purposes. POLLUTION AND OBSTRUCTION OF WATERS.
N J Stat Ann secs 23:5-27, 23:5-28, 23:5-29, 23:5-29.1 (1940); N J Stat Ann sec 23:5-28 (Supp 1968).

Descriptors: *New Jersey, *Legislation, *Fish conservation, *Water pollution control, Fishkill, Wil-

dlife, Explosives, Fish ladders, Fish migration, Fish barriers, Fish toxins, Balance of nature, Drainage, Screens, Land reclamation.
Identifiers: Penalties (Civil).

New Jersey included pollution and obstruction of waters control measures under the state's fish and game laws. The article contained four sections. Section 27 prohibited use of drugs or explosives for taking fish, and imposed a fine of one hundred dollars. Section 28 prohibited allowing deleterious substances to run into state waters in quantities destructive to life or disturbing the habits of fish, under penalty of two hundred dollars. Section 29 prohibited shutting off, drawing off, and screening of waters without first obtaining permission from the State, with the fine set at one hundred dollars. Section 29.1 required that a fish ladder be installed on dams constructed in migratory fish runways, with the fine set at two hundred dollars. (Wheeler-Fla)

INTERSTATE SANITATION COMMISSION - TRI STATE COMPACT.
N J Stat Ann secs 32:18-1 to 32:18-22 (1963).

Descriptors: *New Jersey, *Water pollution control, *Interstate compacts, *Interstate commissions, pollution abatement, public health, water pollution treatment, sewage treatment, Water quality control, State governments, Water policy, Sanitation, New York, Connecticut, Administrative agencies, Legislation.

Because of the tremendous growth of population and rapid development of industry surrounding the New York harbor area, the problem of pollution has become increasingly serious. It now constitutes a grave menace to the health, welfare, and recreational facilities of people living in the area. Since control of future pollution and abatement of existing pollution is of such prime importance to the people of the area, it was felt that the problem could best be solved through cooperation of the States of New Jersey, New York and Connecticut. Consequently, an interstate compact was created to handle the problem. It set up the machinery to cope with the widespread polluted areas. Each state pledged its faithful cooperation in fulfilling the objectives of the compact. This necessitated money, legislation, and regulation from each. It is hoped that with this compact and a combined effort by each state, pollution can be controlled. (Stewart-Fla)

JONES V PENNSYLVANIA RR (DAMAGES CAUSED BY DIVERSION OF WATER).
75 SE 2d 103-106 (W Va 1953).

Descriptors: *West Virginia, *Diversion, *Alteration of flow, *Stream erosion, Judicial decisions, Streamflow, Damages, Obstruction to flow, Barriers, Riparian rights, Bank erosion, Floods, Legal aspects.

Defendant negligently obstructed and diverted the waters of a creek onto the plaintiffs' property causing erosion and damage to the foundations of plaintiffs' dwellings. During one spring, the stone wall forming the north bank of the creek disintegrated at certain points opposite the dwellings of the plaintiffs. Defendant, in making repairs, dumped quantities of stone blocks into these gaps, and some of these blocks extended into the stream. These obstructions caused damages by undermining and washing away parts of plaintiffs' land. The trial court returned a verdict for the plaintiffs on the basis of permanent damage; defendant appealed the verdict and assigned as error the amount of the damage award. The court held that the right of the plaintiff to recover permanent or temporary damages was determined by the nature of the obstruction and not the damage which has been suffered. The fact that the nuisance complained of had been removed prior to trial was held to be conclusive evidence of the temporary nature of the obstruction. The verdict was set aside since no evidence was offered as to the cost of repair, the expenses directly occasioned by injury, or the compensation for loss of use or rent. (Heckerling-Fla)

FEDERAL POWER COMM'N V OREGON (FEDERAL POWER PROJECT).
349 U S 435-457 (1955).

Descriptors: *Hydroelectric plants, *Federal-state water rights conflicts, *Dams, *Oregon, Judicial decisions, Legal aspects, Streams, Alteration of flow, Reservoirs, Public benefits, Recreation, Anadromous fish, Fish conservation, Spawning, Dam construction, Public lands, Columbia River, Water storage, Water utilization, Obstruction to flow, Indian reservations, Federal government, State governments.
Identifiers: Deschutes River, Commerce power.

The Federal Power Commission issued a license permitting a power project to use waters from a United States reservation located in Oregon. The state challenged the Commission's authority. The authority to issue licenses relating to use of navigable waters of the U S springs from the Commerce Clause of the Constitution. The project is to occupy reservations, as distinguished from public lands, and thus, since title to the lands is held by the United States, no state authorization is necessary, provided the use of the water does not conflict with the vested rights of others. The Desert Lands Acts of 1866 and 1870, upon which the state relied for authority, were not applicable since they applied to public lands, not to reservations. The project has provided for a 'reregulating dam' to control interruptions in the natural flow of the stream. The state also challenged the adequacy of provisions for the conservation of anadromous fish. The fish would be cut off from their natural breeding grounds, but the power company had agreed to provide facilities for conserving the runs of anadromous fish, thus satisfying state requirements. The court found that the Commission had acted within its powers in issuing the license. (Shevin-Fla)

FLOOD V EARLE (WAYS OF NECESSITY FRONTING ON A NAVIGABLE LAKE).

71 A 2d 55-58 (Me 1950).

Descriptors: *Maine, *Great ponds, *Navigable waters, *Right of way, Easements, Ponds, Lakes, Public benefits, Public rights, Access routes, Legal aspects, Judicial decisions, Water law, Nonnavigable waters, Real property, Land tenure, Prescriptive rights.
Identifiers: Trespass.

An action in trespass was brought against defendant for traveling across plaintiff's land. The action was referred to a referee who found defendant and plaintiff owned adjacent cottage lots on the shore of Messalonskee Lake, a great pond. These lots had originally been part of a large farm. Defendant's predecessors in title had purchased his lot in 1906; his was the first shore lot sold. The referee ruled that since 1906 defendant and his predecessors have had an implied way of necessity for the main highway to their lot and that this way had been located in part on plaintiff's lot. Plaintiff excepted to the adoption by the court of the referee's report. The court held that if free access to the land over a public navigable water exists, a way by necessity cannot be implied. However, whether a body of water can be used as a highway is a fact question. The referee had a first hand opportunity to determine whether the lake was a navigable highway and whether defendant had free access to the lake from the main road. The court could not say that the referee was not justified in his findings. (Gabrielson-Fla)

WHITE V WABASH RR (ACTION FOR DAMAGES DUE TO ALLEGED DIVERSION OF SURFACE WATERS).

207 SW 2d 505-511 (Mo Ct App 1947).

Descriptors: *Missouri, *Relative rights, *Repulsion (Legal aspects), *Flow augmentation, Surface waters, Surface runoff, Judicial decisions, Rainfall-runoff relationships, Drainage systems, Natural streams, Drainage effects, Drainage engineering, Rainwater, Natural flow, Railroads, Embankments, Legislation, Local governments, Riddance (Legal aspects), Surface drainage, Damages, Diversion.

Plaintiffs brought this action to recover damages sustained because of an alleged diversion of surface waters by the defendant onto and over a farm owned by plaintiffs. Plaintiffs, contended that defendant, in constructing a spur line, had knowingly and unlawfully diverted surface waters from land adjacent to plaintiffs, and, by artificial means, cast water into a branch creek causing it to overflow

LIBRARY U. OF I., URBANA-CHAMPAIGN

and damage plaintiffs' property. The court held that the common law rule that a landowner may guard against and repel surface water, provided he exercises reasonable care in so doing, was applicable in this jurisdiction. Each proprietor is permitted to protect his land against surface water which is the common enemy of all. Plaintiffs' contention that even under this doctrine defendant could not use artificial means to discharge the water onto a neighboring estate was overruled in light of a statute requiring railroad companies to construct suitable ditches to drain surface water into other ditches, drains, or watercourses along their roadbeds. Since plaintiffs' action was based on alleged unlawful actions, and not upon negligence, even though the volume of water in the natural watercourse was substantially increased, the suit failed. (Kelly-Fla)
W69-06895

FULTON V TOWN OF BELMONT (DAMAGE FROM OVERFLOW OF STORM DRAINS).
127 NE 2d 569-572 (Mass Sup Ct 1955).

Descriptors: *Massachusetts, *Surface drainage, *Drains, *Cities, Damages surface waters, Flood damage, Ditches, Pipes, Drainage systems, Conduits, Seepage, Percolating water, Storm drains, Drainage water, Excess water (Soils), Surface runoff, Sewers, Culverts, Judicial decisions, Legal aspects.
Identifiers: *Catch basins, Injunctions (Mandatory).

Plaintiffs were landowners in defendant town. Along the street on which plaintiffs reside was an elevation called a berm, designed to carry surface water to two catch basins at a low point in front of plaintiffs' property. One of the catch basins was drained by a pipe running under plaintiffs' property. The drain and pipe had been requested and installed by plaintiffs' predecessor in title in order to conduct the surface and percolating water from the catch basins to the rear of the property. The city furnished the pipes for the drain. Subsequent owners, including plaintiffs, allowed the drain to remain. Plaintiff sought a mandatory injunction requiring removal of the drains and a damage award for flood damage due to faulty drainage. The court held that defendant had a right to build the catch basins in order to keep the street in repair and safe for travel and that it would not be liable for any water therefrom which floods nearby land. Adjoining landowners may erect drains to prevent flooding of their land, but the city is not responsible for negligent construction thereof because the drain is in the control of the landowner. (Helwig-Fla)
W69-06896

THOMAS V HOLMES (RIGHT TO USE WELL WATER).

306 Ky 632, 208 SW 2d 969-973 (1948).

Descriptors: *Water contracts, *Wells, *Easements, *Kentucky, Water rights, Distribution, Proprietary power, Remedies, Pipelines, Pipes, Judicial decisions, Legal aspects, Usufructuary right, Damages, Relative rights, Real property, Pumping, Contracts.

Appellee, in selling the smaller of two adjoining lots, included a provision in the deed retaining the right to use water from a well situated on the lot conveyed. In 1945, this lot was conveyed to appellant. At that time, a pump, originally installed by the appellee, supplied well water to both of the lots. Later, having purchased a new pump for the well, appellant advised appellee that he would cease pumping water for appellee's use. Appellee sued to enjoin such threatened action and to recover damages for interference with his use of the well and the pump on appellant's lot. The chancellor found that appellee had a right to use the pump provided he paid one-half of the cost of the new pump and for one-half of the pump's electricity. The appellate court reversed, holding that appellee had a right to use the well water and that this right comprehended the ability to do all things reasonably necessary in order to perfect such right, to wit installing his own pump. However, there was no binding agreement allowing appellee to use appellant's pump, and the chancellor could not create such a contract for the parties. (Gabrielson-Fla)

POYNTER V COUNTY OF OTTER TAIL (LIABILITIES RESULTING FROM CONSTRUCTIONS OVER WATERCOURSES).
25 NW 2d 708-718 (Minn 1947).

Descriptors: *Minnesota, *Obstruction to flow, *Floods, *Culverts, Judicial decisions, Damages, Water law, Legal aspects, Natural flow, Natural streams, Highways, Estimating, Maximum probable flood, Roads, Construction, Dams.
Identifiers: Proximate cause.

Plaintiff brought suit claiming that defendant had negligently constructed a highway culvert which obstructed the natural flow of Otter Tail River and that such obstruction was the proximate cause of damage to plaintiff's crops. Twenty-five years prior to the highway construction, a dam had been built on the river which diverted much of the river water and substantially reduced the size of a stream flowing adjacent to plaintiff's tract. It was over this stream that the highway in question was constructed. The culvert was constructed to accommodate the flow which had been constant for the past twenty-five years. The damages claimed occurred after a period of unprecedented flood. The court, stating that one who erects a structure across a waterway must adequately provide for the passage of waters reasonably expected to flow thereunder, held that defendant, in relying upon conditions existing for twenty-five years, was not liable for damages caused by obstructing the natural flow when such flow resulted from an unprecedented flood. CITY OF PASSAIC V CITY OF CLIFTON (COORDINATED FLOOD CONTROL PLANS).

14 N J 136, 101 A 2d 530-535 (1953).

Descriptors: *New Jersey, *Flood control, *Cities, *Administrative agencies, Legal aspects, Flood protection, Judicial decisions, Streams, Culverts, Flow augmentation, Runoff, Permits, Construction, Regulation, Natural flow, Relative rights, Costs.
Identifiers: Box culverts.

Plaintiff city of Passaic petitioned the Division of Water Policy and Supply to impose conditions on permits granted to defendant city of Clifton which gave authorization to construct flood control devices in a natural stream which had its source in defendant city and flowed through plaintiff city. Plaintiff stated that defendant's improvements would increase the stream's velocity of flow and that the increase would require plaintiff to make additional expenditures in connection with its own flood control plans. The petition was denied, and plaintiff appealed. The supreme court affirmed, stating that the two cities' plans provided a coordinated, practical, and economical solution to the problem of flood control on the stream. The court noted that the expense of alternatives to defendant's plan was prohibitive, while the cost of altering plaintiff's program to accommodate defendant's activities was relatively small. JACOBSON V KANDIYOHI (CONSTRUCTION OF A DRAINAGE DITCH).

48 NW 2d 441-445 (Minn 1951).

Descriptors: *Minnesota, *Drains, *Drainage programs, *Ditches, Local governments, Lakes, Drainage effects, Drainage systems, Dams, Judicial decisions, Legal aspects, Damages, Flooding, Water rights, Artificial watercourses, Administrative agencies, Administrative decisions, Legislation, Water levels.

This is an appeal from the district court's order vacating an order of a county board establishing a county ditch. The supreme court upheld the lower court's finding since the proposed ditch would drain into a previously completed ditch in an increased amount to the damage of adjacent property. Once a ditch system is established, the order creating it constitutes a judgment in rem. The res of the order is the watercourse and all lands damaged or benefited by it. Since the landowners involved in the construction of the first ditch were not parties to this proceeding, the order of the board was without authority. Further, under section 106.021, subd 3, the board was without power to establish the ditch without authority from the commissioner of conservation where, as in this instance, its construction would affect the level of a connected lake. Finally, a member of the county board was disclosed to be an interested party to the proceedings. (Kahle-Fla)
W69-06903

SWOBODA V RENVILLE COUNTY (PROCEEDING TO ESTABLISH VALIDITY OF PETITION FOR A DRAINAGE DITCH).
62 NW 2d 816-822 (Minn 1954).

Descriptors: *Minnesota, *Drainage systems, *Eminent domain, *Land tenure, Local governments, Relative rights, Controlled drainage, Drainage programs, Drainage water, Surface waters, Rain water, Drains, Ditches, Judicial decisions, Ravines, Artificial Watercourses, Easements, Condemnation, Riddance (Legal aspects).

This proceeding was to determine whether an amended petition filed with the county board for establishment of a drainage ditch fulfilled the statutory requirement that such a petition must bear the signatures of the owners of fifty-one per cent of the land traversed by the ditch. Appellant contended that the county had not secured the signatures of several 'owners' of land necessary to meet the percentage requirement. The court found that appellant's contentions were unfounded and held that owners of the land traversed by a natural waterway which would become part of the drainage system without improvement to the natural waterway were not necessary parties to the signing of the petition. Their land was not to be counted in the computation of the percentage necessary to render the petition valid. The court also held that mortgagees of real estate, vendors of real estate, the county which held a two rod easement over part of the proposed path of the ditch, and the seller of land who gave a warranty deed and guaranteed to make good to the buyers any assessment for the proposed ditch, were not 'owners' within the meaning of the statute. WHITE CAP SEA FOODS, INC V PANZNER (RIGHT TO USE A CANAL).
1 App Div 2d 963, 150 NYS 2d 322-323 (Sup Ct 1956).

Descriptors: *New York, *Canals, *Docks, *Boat, Judicial decisions, Legal aspects, Channels, Barriers, Riparian rights, Riparian land, Riparian waters, Relative rights.
Identifiers: Catwalks, Injunctions (Prohibitory), Injunctions (Mandatory).

Plaintiff's predecessors in interest had been conveyed the right to use a canal. The lower court held that plaintiff was thus allowed to use the canal for reasonable ingress and egress of craft to his dock for loading and unloading. The defendant was required to remove a catwalk and certain poles which interfered with the plaintiff's use of the dock and was enjoined from interfering with the use of the waterway. The appellate court affirmed the lower court opinion requiring the defendant to remove the obstacles which interfered with the plaintiff's use of the dock; however, the lower court's opinion was modified to an extent by the appellate opinion which specified that plaintiff was not to use his rights in the canal in such a way as to interfere with the defendant's use. Thus, each party was to have free use of the waters as long as they did not interfere with the rights of the other. (Shevin-Fla)

ERA OF MILITANT FISHING JURISDICTION - STUDY OF THE FLORIDA TERRITORIAL WATERS ACT OF 1963,
Dorian Cowan.
U Miami L Rev, Vol 23, No 1, pp 160-181, Fall 1968. 22 p, 156 ref.

Descriptors: *Jurisdiction, *Florida, *Submerged Lands Act, *Ownership of beds, Littoral, Legislation, Federal jurisdiction, State jurisdiction, Continental shelf, Commercial fishing, Political aspects, International law, International waters, Boundaries (Property), Governments, Legal aspects, Water law, Shores, Fishing, Coasts.

The economic importance of off-shore waters and beds has quickened the interest of the maritime nations in extending their jurisdiction over coastal waters and beds. In the United States, the controversy is over whether the coastal states of the federal government have title to the adjoining seas and beds. Under the Federal Submerged Lands Act, title to the ocean beds was declared to be in the states. Earlier, the court had acknowledged that regulation of coastal fishing was a proper exercise of state police powers only where there was no conflict with federal regulations. Federal regulation was authorized for the purposes of commerce, national defense, and international affairs. Because unrestricted fishing was regarded as a serious threat to national resources, both the United States and the state of Florida passed laws requiring the licensing of foreign fishing vessels. The Florida Territorial Water Act of 1963 denies fishing privileges to the communist community of nations. Licenses are issued on the basis of reciprocity and friendly, neutral nations are favored. It is submitted that questions of constitutionality and conflict with federal fishing regulations the exigencies of national foreign policy will preclude a frequent application of this statute. TROSCLAIR V SUPERIOR OIL CO (DAMAGES TO OYSTERS FROM OIL CONTAMINATION).
219 So 2d 278-282 (La Ct App 1969).

Descriptors: *Louisiana, *Oysters, *Oil wells, *Water pollution, Reasonable use, Leases, Drilling, Civil law, Judicial decisions, Oil wastes, Water pollution, Sources, Water pollution effects, Saline water, Reefs, Damages, Seashores, Mineral industry, Overflow, Legal aspects.

Plaintiff brought this action to recover damages for the loss of oysters through oil contamination. Plaintiff alleged that the overflow of oil and waste from a pit used in connection with defendant's drilling operations caused plaintiff's oysters to taste oily and rendered them unmarketable. The court held that the plaintiff failed to support its burden of proof as to defendant's negligence in the alleged overflow. The court found that in light of testimony to the effect that the oysters would have purged themselves of the taste in two or three weeks, plaintiff failed to sufficiently prove his damages. The court further found that even if defendant's oysters had been contaminated by oil overflow, the mineral lease held by defendants was prior in time and right to the oyster bed lease. Therefore, plaintiff would have the burden of showing that defendant had acted in an unduely negligent manner in the working of its mineral lease. (Kelly-Fla)

MADISON METROPOLITAN SEWERAGE DIST V COMM ON WATER POLLUTION (DISCHARGE OF SEWAGE INTO LAKE WATER).
260 Wis 229, 50 NW 2d 424-439 (1951).

Descriptors: *Wisconsin, *Sewage effluents, *Water pollution control, *Local governments, State governments, Biochemical oxygen demand, Odor-producing algae, Pollution abatement, Sewage treatment, Sewage disposal, Waste disposal, Water pollution, Lakes, Streams, Sewage, Remedies, Judicial decisions, Legal aspects.

Petitioner sewerage district, a public corporation, discharged the effluent from its sewage treatment plants into surrounding lakes. The inorganic chemicals contained in the effluent contributed substantially to the abnormal growth of a type of algae which created objectionable conditions in those lakes. Respondent, a public agency acting under powers granted by the legislature ordered petitioner to modify and improve its sewage disposal system so as to eliminate the algae nuisance. The circuit court affirmed the lower court's order and petitioner appealed. The supreme court held that the right of a municipality to empty its sewage into a stream or river was merely a legislative license revocable whenever public health and safety required. The respondent did not have to state expressly that appellant was creating a nuisance when its findings substantially demonstrated that a nuisance existed as a result of appellant's operations. (Gabrielson-Fla)
W69-06909

BUNDY V CITY OF SULLIVAN (ARTIFICIAL CONTROL OF SURFACE DRAINAGE).
1 Ill App 2d 212, 117 NE 2d 302-303 (1954).

Descriptors: *Illinois, *Natural flow, *Drainage systems, *Flood damage, Cities, Drainage water, Artificial watercourses, Natural streams, Surface waters, Surface drainage, Surface runoff, Judicial decisions, Watercourses (Legal), Ditches.

Plaintiff brought this action to recover for damages caused by the draining of water onto his land. The defendant had constructed a large artificial ditch and had connected it with another ditch which led directly onto the plaintiff's land. As a result of this network of ditches, drainage water from the defendant's streets was channeled onto the plaintiff's property. The plaintiff alleged that surface waters can not be drained through artificial channels onto the land of another. However, the court held that the decisive question was not whether the drainage system was artificial but whether it altered the general course of natural drainage. The plaintiff's complaint failed to allege that the defendant's system detrimentally altered the natural drainage. Futhermore, the plaintiff elected not to amend his complaint. Judgment for the defendant was affirmed. (Stewart-Fla)
W69-06910

MITCHEL V DOVER (BACKWATER IN SEWERAGE SYSTEM).
99 A 2d 409-412 (NH 1953).

Descriptors: *New Hampshire, *Sewers, *Backwater, *Drains, Obstruction to flow, Sewage, Local governments, Sewage disposal, Sewage effluents, Remedies, Damages, Judicial decisions, Legal aspects, Operation and maintenance.
Identifiers: Questions of fact, Causes of action, Nonsuit, Duty of care.

Plaintiffs brought this action to recover damages caused by the backing up of water and sewage from defendant's sewer. The effluents moved through plaintiffs' drains and into the basements of their stores. Defendant excepted to the denial of its motion for a nonsuit. When the judge later declared a mistrial, defendant appealed. The court, finding it to be a question of fact whether defendant's acts constituted negligence, ordered a new trial. Although an essential element of proof in plaintiffs' action involved a showing that the private drain was rightfully connected to the sewer, it was logical to infer from the previous actions of the defendant that the connection of the plaintiffs' drains with the public sewer was rightful. The court noted that the duty owed by a municipality to a person liable to be damaged by the operation of its sewerage system was that of ordinary and prudent care. (Gabrielson-Fla)
W69-06911

ELDER V DELCOUR (NONNAVIGABLE WATERS AND PRIVATE OWNERSHIP).

263 SW 2d 221-228 (Ct App Mo 1953).

Descriptors: *Missouri, *Navigable rivers, *Ownership of beds, *Riparian rights, Public rights, Surface waters, Navigation, Riparian waters, Boundaries (Property), Easements, Nonnavigable waters, Judicial decisions, Fishing, Boats, Transportation, Relative rights, Remedies, Land tenure.

Plaintiff brought this suit to establish his right to fish in a portion of a certain river. The defendant contended that, because the river was nonnavigable, he had a legal right to prevent the public from using the river where it flowed through his property. The court acknowledged that if the waters were navigable, the riparian owner was entitled to have access to and use of the waters for all purposes not inconsistent with the public easement. The court held that in order to constitute a navigable body of water, the river must be susceptible of being used for purposes of trade, travel, and commerce. However, the court found that the river was not capable of supporting any type of commercial navigation; its only useful purpose was for fishing. Consequently, the defendant had a right to restrain the public from using the river on his land. (Stewart-Fla)

BOWES V CITY OF CHICAGO (INTERFERENCE WITH NAVIGATION BY CONSTRUCTION OF FILTRATION PLANT).
3 Ill 2d 175, 120 NE 2d 15-32 (1954).

Descriptors: *Illinois, *Navigable waters, *Riparian rights, *Harbors, Cities, Filtration, Rivers, Boundaries (Property), River beds, Ownership of beds, Riparian waters, Federal government, State governments, Navigation, Contracts, Financing, Taxes, Construction, Judicial decisions, Legal aspects.
Identifiers: Filtration plants, Corps of engineers, Injunctions (Prohibitory), Restrictive covenants.

Appellant city sought to construct a water filtration plant in its harbor on submerged land under navigable water. It received a permit for the construction from the Army after a finding that the proposed construction would not impair navigation. Appellees were of two groups: (1) taxpayers and (2) property owners claiming violation of contract rights. Appellee taxpayers sought to have the construction enjoined on the ground that it impaired navigation. Appellee property owners sought to have it enjoined because the construction would violate certain covenants with appellant. The property owners had deeded their land and riparian rights to appellant upon the condition that the land would never be used for other than park purposes. From an order granting an injunction, appellant appealed. The court reversed holding: (1) that although the state held title to land under navigable waters in trust for the benefit of all interests, the plant would not impair navigation, and (2) that the plant was to

LIBRARY U. OF I., URBANA-CHAMPAIGN

be built on land other than that covered by the covenants between the parties. (Helwig-Fla)

GREAT LAKES BASIN COMPACT.

Minn Stat Ann sec 1.21 (1967), as amended, (Supp 1968).

Descriptors: *Minnesota, *Great Lakes region, *Interstate commissions, *Interstate compacts, Great Lakes, navigation, Wildlife, Fish, Soil erosion, Soil conservation, Diversion, Water levels, Water resources development, Water policy, St Lawrence River, Fishing, Natural resources, Regulation.
Identifiers: *Great Lakes Basin Compact.

The Great Lakes River Basin Compact has as its purpose the development and conservation of the water resources of the Great Lakes Basin. The Great Lakes Commission, as created under the compact, will exercise jurisdiction over so much of the following as is included within the signatory states: Lakes Erie, Huron, Michigan, Ontario, St Clair, and Superior; the St Lawrence River; and all rivers, ponds, lakes and other watercourses connecting with the St Lawrence. The composition of the Commission is established. The signatory states agree to consider the Commission's recommendations with respect to: lake levels, pollution, navigation, fishing and wildlife resources, soil erosion, and diversion of waters from and into the Basin. Any state may withdraw from the compact after six months notice. (Kahle-Fla)

LEGAL STRUCTURES FOR INTERNATIONAL SUPERVISION OF WEATHER MODIFICATION TECHNIQUES,
Raphael J. Moses, and James N. Corbridge, Jr.
International Conference on Water for Peace, Vol 2, pp 410-420 (1968). 10 p, 21 ref. For 8 volume proceedings see Vol 2, No 9, Field 06B, W69-03305.

Descriptors: *International law, *Public benefits, *Treaties, *Weather modification, Legislation, Adjudication procedure, Weather, Artificial precipitation, Cloud seeding, Conservation, Droughts, Legal aspects, Meteorology, Political aspects, Rain, Water supply, International commissions.

Both social and financial benefits are derived from programs of scientific weather modification. Legal structures must be established on both the national and international level to supervise and administer weather modification programs. To date, litigation is insufficient to reveal the doctrines and concepts which the courts will employ to resolve private weather modification disputes. Conceding the fact that a case by case resolution of disputes under common law principles gives rise to a degree of uncertainty in the law, nevertheless no statutes have been passed which purport to affect the liability of operators vis-a-vis landowners. So far, federal concern has centered about investigating and coordinating weather modification rather than regulating it. Most existing law concerning weather modification has evolved from property rights and remedies for invasion of these rights. These legal structures appear to be inadequate. Since moisture-laden clouds move without regard for state or national boundaries, regulation and reparation cannot be parochial in character; a central administrative agency in each country seems appropriate. Perhaps the national government should underwrite the excess risks of prospective damage claims from large-scale weather modification schemes. The World Meteorological Organization is an existing regulatory authority for outer space, and it would be a simple matter to adapt its organizational structure to the task of regulating weather modification as well. (Scott-Fla)
W69-06916

BURKHARDT V UNITED STATES (CONGRESSIONAL AUTHORITY TO PAY DEBTS NOT OTHERWISE PROVIDED FOR IN LAW).
84 F Supp 553-560 (Ct Cl 1949).

Descriptors: *Compensation, *Dams, *Federal government, *Hydroelectric plants, Judicial decisions, Wisconsin, Condemnation, Eminent domain, Damages, Navigation, Riparian rights, Legislation, Navigable waters, Debt, United States, Water levels, Tailwater, Federal jurisdiction, Dam construction.
Identifiers: *Constitutional law.

The plaintiff brought this suit to recover compensation for the loss of power capacity in its hydroelectric plant. The loss was due to the defendant's construction of a dam for navigational purposes. The effect of the dam was to lower the water level of the river upon which the plaintiff was dependent to generate power. The trial court entered a judgment for the defendant. It held that the government operations to aid navigation often damage or interfere with advantages enjoyed by riparian owners, but the mere fact that damage has occurred confers upon the courts no power to require compensation where there is no taking of property. However, shortly after the trial court rendered its decision, Congress passed an act authorizing the Secretary of the Treasury to pay the plaintiff in full satisfaction of the claim for damages caused by the diminution of generating capacity. Such moral or equitable losses may be compensated by Congressional authority under its constitutional power to provide for the payment of debts. The court acknowledged that Congress has authority to create a new cause of action and upheld the plaintiff's claim. Without the new Congressional legislation, the plaintiff had no cause of action. (Stewart-Fla)
W69-06917

WALKER V FELMONT OIL CORP (OWNERSHIP OF BEDS AND UNDERWATER MINERAL LEASES).

136 F Supp 584-592 (W D Ky 1955).

Descriptors: *Kentucky, *Ownership of beds, *Leases, *Mineral industry, Ohio River, Patents, Judicial decisions, Exploration, Natural resources, Administrative agencies, State governments, Local governments, River beds, Riparian lands, Oil, Natural gas, Exploitation, Land tenure, Remedies, Riparian rights, Beds under water.

The plaintiffs brought this suit seeking a judgment confirming their alleged exclusive rights to oil and gas under the northern half of the Ohio River bed. Three groups held conflicting interests, each claiming the exclusive right to extract oil and gas from the river bed. All the parties conceded the sovereign power of Kentucky to permit the development of oil and gas deposits in the Ohio River bed. They disagreed sharply as to legislative acts advanced as authority. Plaintiffs' claim the rights by virtue of certain land patents purporting to convey to them title to portions of the river bed. However, the court held the patents invalid. The statute authorizing patents contemplated the conveyance of land that could be settled and lived on, not of submerged land. One group of defendants acquired the rights to the oil and gas from a county. This acquisition was also held invalid. The statute authorizing the county to grant leases applied only to sand and gravel deposits. The third defendant based his claim to the minerals on a lease from the state property and Buildings Commission. The court upheld this claim since the legislature had given the commission the power to dispose of state land not needed for public use. The court concluded that the power to sell real property includes the power to execute oil and gas leases. (Stewart-Fla)
W69-06918

DANZIGER V UNITED STATES (EMINENT DOMAIN FOR LEVEE CONSTRUCTION).
93 F Supp 70-72 (ED La 1950).

Descriptors: *Eminent domain, *Federal government, *Levees, *Flood control, Judicial decisions, Louisiana, Engineering structures, Dikes, Construction, Navigable waters, Mississippi River, Flood protection, Public rights, State governments, Easements, Compensation, Appropriation, Repairing, Legal aspects.
Identifiers: Servitudes.

The plaintiffs brought this suit to recover the value of property allegedly taken by the defendant for construction of a levee in Louisiana. The court noted that, under Louisiana law, land located along navigable waters is subject to a servitude in favor of the public for the purpose of constructing and repairing levees. However, state property is appropriated by state levee districts, not by the federal government. The taking is an exercise of the state police power. The court dismissed the action. The defendant federal government had not appropriated the property, and, thus, there was no basis for a cause of action against it. (Stewart-Fla)

PEOPLE V SYSTEM PROPERTIES, INC (OWNERSHIP OF THE BEDS OF NAVIGABLE WATERS).

281 App Div 433, 120 NYS 2d 269-281 (1953).

Descriptors: *New York, *Ownership of beds, *Navigable waters, *Dams, Beds under water, Beds, Navigable rivers, Riparian rights, State governments, Legislation, Judicial decisions, Navigation, Rivers, Lakes, River beds, Nonnavigable waters, Reservoirs, Lake beds, Recreation, Prescriptive rights, Legal aspects.
Identifiers: Navigable in fact, Injunctions (Prohibitory).

The people of the state, joined by several reparian owners, sought a judgment declaring the ownership of the bed of a certain navigable lake and its tributary to be in the state. The riparian owners also sought to enjoin defendant from maintaining a dam on the tributary which caused the water level of the lake to rise. The trial court found that the state had the power to regulate the lake but decided that it was in the best interests of all concerned that maintenance of the dam and regulation of the lake level be placed under court supervision. The appellate court reversed, holding that the trial court had exceeded its power and had invaded the province of the legislature. The court declared that the state owned the bed of the lake and its tributaries and had the right to control the use of the waters. The sovereign powers of the state are exercisable by the legislature alone; riparian owners cannot force exercise by the state of its reserve powers to demand removal of a dam. In addition, assertion by the riparian owners in this case of their riparian right was barred by the running of the prescriptive period. (Helwig-Fla)

REGIONAL SANITARY SEWER DISTRICT LAW.

Minn Stat Ann secs 115.61 to 115.67 (1964), as amended, (Supp 1969).

Descriptors: *Minnesota, *Sewage districts, *Cities, *Water pollution control, Industrial wastes, Financing, Local governments, Legislation, Legal aspects, Land tenure, Administrative agencies, Supervisory control (Power), Taxes, Condemnation, Sewage, Sewage treatment, Treatment facilities, Regulation.
Identifiers: *Police power.

A sanitary sewer district shall be a municipal corporation responsible for acquiring and maintaining facilities for treatment of sewage and industrial wastes to prevent water pollution. It may sue and be sued, acquire property, be exempt from taxation, and exercise all powers granted municipalities in Minnesota. All powers shall be exercised under authority of the board of directors, which shall be exercised according to the rules of this section. The chief executive officer shall be chosen by the board and hold office on the same basis as a village manager under secs. 412.641-.751, except all appointees shall be subject to board approval. The acquisition of property by a district shall not be restricted or controlled by other local government, except under the police power. Any municipality may request annexation of its territory to a district, subject to board and Water Pollution Control Commission approval. All annexed territory shall be subject to taxation by the district. The provisions of this act are severable. (Harris-Fla)
W69-06925

WATER POLLUTION CONTROL.

Minn Stat Ann secs 115.17 (6), 115.19, 115.26 to 115.30 (1964), as amended (Supp 1968).

Descriptors: *Minnesota, *Water pollution, *Water resources development, *Administrative agencies, Public health, Legislation, Conservation, Project purposes, Public utilities, Resource development, Treatment facilities, Sewage treatment, Local governments, Septic tanks, Sewage disposal, Natural resources, Water pollution control.

The duties of the water pollution control advisory committee are to assist the Pollution Control Commission and to help formulate a statewide comprehensive policy for the conservation and development of water resources and the prevention of pollution. A sanitary district may be created to promote public health and welfare by providing an efficient sewage and disposal system. Each state congressional district may construct, improve, and maintain a system for pollution prevention and control. The district may require any person to use the disposal system. The district may regulate the construction and use of all sanitary facilities in order to protect public health. It may prohibit the use of facilities not connected with the district disposal system. A district may enter any joint project for the purpose of constructing, improving, and maintaining any system or facilities. (Stewart-Fla)

STATE LANDS; SALES, INVESTMENT OF PROCEEDS.
Minn Stat Ann secs 92.01, 92.04, 92.12, 92.45, 92.50 to 92.59 (1964) as amended (Supp 1968).

Descriptors: *Minnesota, *Mississippi River, *Lakes shores, *Land management, Drainage practices, Legislation, Federal government, Federal-state water rights conflicts, Lakes, Land use, Public lands, Rivers, Water policy, Legal aspects.

'State lands' or 'state public lands' are lands granted to the state by act of Congress. Minimum prices for the sale of such lands are established. Valuation of land and improvements shall be made, when necessary, by appointed state appraisers who shall also report which lands, in their opinion, should be drained. Notice requirements and provisions for separate sales of timber are set out. State lands bordering on meandered lakes or other public waters are withdrawn from sale except as they may be required by the federal government in connection with projects for the improvement of navigation on the Mississippi River. Leasing of mineral rights on unsold land is also provided for. (Kahle-Fla)
W69-06927

TOWNS, SPECIAL PROVISIONS.
Minn Stat Ann secs 368.50, 368.56 to 368.58, 368.78 (1966), as amended, (Supp 1968).

Descriptors: *Minnesota, *Water conservation, *Zoning, *Sewers, Sewage disposal, Water works, Legislation, State governments, Municipal water, Property values, Population, Reservoirs, Construction, Cities, Local governments.

Towns with populations in excess of 3000 and with assessed property values in excess of $10,000,000 may erect and maintain waterworks and sewage disposal plants. Towns with population in excess of 450,000 and assessed property value in excess of 280,000,000 or towns within 10 miles of a city of the first class may adopt zoning resolutions affecting water supply conservation upon the approval of 50 percent of those voting at a town meeting. The resolutions shall become effective 10 days after adoption unless 50 percent of the property owners within the affected area file written objection with the town clerk. Two thirds of the property owners in the affected area must approve any modification in the adopted resolution. Town boards are authorized to construct and maintain sewers for drainage purposes and to acquire land to provide for a reservoir. (Kahle-Fla)

NAMING LAKES, RIVERS, STREAMS, AND BODIES OF WATER.
Minn Stat Ann secs 378.01 to 378.06 (1968), as amended, (Supp 1969).

Descriptors: *Minnesota, *Lakes, *Rivers, *Local governments, Ponds, Legislation, State governments, Regulation, Administrative agencies, Legal aspects.
Identifiers: *Naming of water bodies.

The county board may be petitioned by any 15 voters of the county or the state Geographic Board to name, or to change the name, of any lake, river, stream or body of water within the county. Notice of hearing must be served on certain public officials. All interested parties may appear at the hearing which shall be held by the county board wherein the name of the body of water shall be determined. Before any action may be taken on a petition, bond must be posted by the petitioners to cover all reasonable expense to the county. Names of existing bodies of water are not to be duplicated. (Kahle-Fla)

INCORPORATION, CITIES FOURTH CLASS.

Minn Stat Ann secs 411.01, 411.40 (1958), as amended, (Supp 1968).

Descriptors: *Minnesota, *Drainage, *Cities, *City planning, Local governments, Cesspools, Legislation, Municipal water, Landfills, Navigable waters, Boundaries (Surfaces), Bridges, Harbors, Levees, Tunnels, Water pollution control, Regulation, Sewers.

Villages with not less than 1000 nor more than 10,000 inhabitants may incorporate as a city of the fourth class. The council of such a city shall have the following powers and duties: to regulate the use of bridges, viaducts, tunnels, drains, sewers, and cesspools; to compel railways to keep open ditches and drains along their tracks; to restrain pollution of any waters within or adjacent to the city; to compel the owner of low ground where water is liable to collect and become stagnant to fill or drain such low places; to regulate and supervise navigable waters; to make regulations in regard to the use of vessels and opening of bridges; to appoint harbor masters and define their duties; and to prevent the removal of sand or other material from levees, embankments or boundary lines of public waters. (Kahle-Fla)

VILLAGE POWERS.
Minn Stat Ann secs 412.221, 412.491, 412.521 (1958), as amended, (Supp 1968).

Descriptors: *Legislation, *Local governments, *Recreation facilities, *City planning, Community development, Cities, Planning, Parks, Sewage systems, Public benefits, Health, Project planning, State governments, Navigable waters, Minnesota, Harbors, Piers, Construction, Maintenance, Regulation.

The village council shall have power to construct, alter and maintain streets, sidewalks, parks, squares, and other public grounds. The council is also empowered to regulate the water supply, waterworks, sewer system and to control the location, construction, and use of piers, docks, and wharves. The council is authorized to acquire and operate ferries across any river in the village. The council has the power to define nuisances and to provide for the prevention or abatement thereof. To effectuate the powers relating to parks and recreational facilities, the park board may employ the necessary personnel. In addition, it may construct paths, roads, buildings, and any related recreational facilities. The board may, with consent of village council, make contracts and leases for construction and operation of these facilities. Finally, the park board may provide music and free entertainment for the general public. (Stewart-Fla)

MUNICIPAL POWERS.
Minn Stat Ann secs 429.011, 429.021, 435.46, 435.47 (1947), as amended (Supp 1968).

Descriptors: *Minnesota, *Local governments, *Cities, *Construction, Water works, Public utilities, Maintenance, Legislation, Public benefits, Storm drains, Cities, Flood control, Water supply, Leases, Contracts, Conduits.

The term municipality is defined for purposes of this act. The council of a municipality has the power to acquire, widen, and improve any street and may construct and maintain sidewalks, curbs, and parking strips. The council is authorized to construct, extend, and maintain storm, sewer and waterworks systems and related facilities. The council may abate nuisances and drain swamps or marshes on public or private property. The council of any fourth class city may contract or enter into agreements with any adjoining municipality having a water system, in order to furnish water to its citizens. The adjoining municipality will be allowed to lay the water mains under the direction of the council. The council of any village adjacent to a first class city is authorized to purchase water from the city for re-sale to the village inhabitants provided such village has a water and sewer main connecting to the city system. BOATS, VESSELS; ACTIONS AGAINST.

Minn Stat Ann secs 579.01 to 579.08, 624.69 (1964), as amended (Supp 1968).

Descriptors: *Minnesota, *Boats, *Ships, *Adjudication procedure, Damages, Legislation, Judicial decisions, Navigable waters, State governments, State jurisdiction, Navigation, Legal aspects.
Identifiers: *Judgment liens, Security bonds, Execution sales.

Vessels used in navigable waters of the state are made liable for the following claims which constitute liens: (1) debts contracted by the owner or master for supplies, services, or repairs; (2) wharfage and anchorage fees; (3) damage claims resulting from the non-performance of contracts; (4) injuries to persons or property by the vessel. Provisions for the seizure and execution sale of the vessel are set forth. Upon the delivery of bond to the plaintiff in an amount adequate to cover alleged damages, the vessel may be released prior to judgment where there is court approval. The master or owner may be personally bound if the judgment remains unpaid for over 60 days. Appeals from an adverse judgment may be taken as in other cases. Actions under this chapter must be brought within one year. (Kahle-Fla)

PUBLIC USES FOR WHICH PRIVATE PROPERTY MAY BE TAKEN OR DAMAGED.

W Va Code Ann secs 54-1-2, 54-1-3a, 54-1-9, 54-1-10 (1966).

Descriptors: *West Virginia, *Eminent domain, *Canals, *Water supply, Natural resources, Pipelines, Reservoirs, Reservoir storage, Water conveyance, Water storage, Water resources development, Condemnation, Legal aspects, Sewers, Dams, Railroads, Industrial water, Proprietary power, Easements, Real property, Legislation, Impounded waters, Land tenure, Public benefits, Conveyance structures, Pumping.

Private property may be taken or damaged for the construction, maintenance, and operation of canals and water plants for public use. The right of eminent domain in regard to water plant facilities extends to the appropriation of property for sites for pumping stations, reservoirs, cisterns, storage dams and conveyance structures. Lands which may be flooded by the impounded waters are subject to condemnation. Any spring or stream may be taken for public use. The right of eminent domain extends to property required for construction, maintenance, and operation of sewer systems and related facilities. Any railroad company may impound and consume any and all water located on lands adjacent to its road, provided such water is not required by the owner of such property. (Katz-Fla)

INTERSTATE SANITATION COMMISSION.
Conn Gen Stat Ann sec 25-55 to 25-66 (1958), as amended, (Supp 1968).

Descriptors: *Connecticut, *Interstate compacts, *Interstate comm'ns, *Water resources development, Interstate rivers, Coasts, Continental margin, Streams, Public health, Public benefits, Tidal waters, Pollution abatement, Legislation, Water pollution control, Sewers, Waste disposal, Sewage sludge, Bacteria, E coli, Classification, Legal aspects, State governments, Administrative agencies, New York, New Jersey, Shellfish.

The states of Connecticut, New Jersey, and New York have entered into a tri-state compact to abate increasingly serious pollution of harbors and coastal and tidal waters. The compact provides for the creation of an Interstate Sanitation Commission comprized of five Commissioners from each state. The Commission is charged with administering pollution regulations set forth in the compact within the Interstate Sanitation District. This District consists of the major coastal, estuarial and tidal waters within the signatory states. These waters are to be classified by the Commission into two divisions. Class 'A' waters are to be used for recreational purposes, shellfish culture, or development of fish life. Sewage discharged into these waters must be kept free from all floating solids and free from 60% of all suspended solids. All other waters are to be considered Class 'B' waters, and sewage discharged into these waters is required to be free from all floating solids and free from 10% of suspended solids. The commission may bring a court action in any of the several states to enforce the provisions of this compact. (Katz-Fla)

FLOOD CONTROL AND BEACH EROSION: STATE ASSISTANCE.
Conn Gen Stat Ann secs 25-69 to 25-71, 25-74 (1958).

Descriptors: *Connecticut, *Floods, *Shore protection, *Flood control, Storms, Beaches, Beach erosion, High water mark, Low water mark, Ownership of beds, Dams, Tidal waters, Flood Plains, Flood walls, Flood protection, Legal aspects, Legislation, Watercourses (Legal), Tidal effects, Construction costs, Shore-line cover, Project purposes, Project benefits, Public benefits, Land tenure, State governments, Water resources development.

The state has undertaken the task of constructing protective works on or near shores and beaches within areas susceptible to damage from severe

torms accompanied by high winds, abnormally igh tides and tide flooding. State protection of the xposed areas is within the public interest since the ndividual landowners would be unable to maintain omparable works without cooperation from butting landowners, and since title to lands etween high and low water marks is vested in the tate. Encroachment limits are to be provided long waterways, and flood control features at ams and reservoirs are to be utilized as part of any lood control projects. Lands fronting on the cean, bays, inlets, coves, or rivers in which tides ccur; lands exposed to erosion through wave ac- ion; and open beach areas or lands subject to inun- ation because of their geographical situation are efined as exposed areas. The exposed areas are elimited by natural configuration, not political oundaries. The water resources commission is uthorized to pay stated percentages for work done ith local governments and private citizens, and to rrange for use of available federal and municipal acilities. (Kelly-Fla)

IDD MFG CO V TOWN OF BLOOMFIELD, SSEX COUNTY (EROSION OF STREAMBED HROUGH ACCELERATED FLOW).

8 N J Super 355, 100 A 2d 708-713 (1953).

Descriptors: *New Jersey, *Alteration of flow, Bank erosion, *Stream erosion, Riparian rights, treambeds, Streams, Local governments, Dams, Damages, Remedies, Judicial decisions, Augmenta- on of flow, Legal aspects, Cities, Banks, Erosion.
Identifiers: *Contributory negligence.

Plaintiff alleged that improvements made by defen- ants caused the flow of the stream bordering plaintiff's property to accelerate. This accelerated flow eroded the stream bed and undermined the banks of the stream adjacent to plaintiff's property, damaging a building. Plaintiff sued to recover for this damage. The court rejected defendants' argument that, since plaintiff's injuries were incidental to acts done under legislative authority, the injuries sustained were damnum absque injuria. The court also found that defendant's actions constituted misfeasance, not nonfeasance, in that it was an active wrongdoing. However, the court held that plaintiff's negligent removal of 30 or 40 tons of stone from the stream bed was a concurrent cause of the cutting away of the stream bed and of the results which followed. Therefore, plaintiff's contributory negligence barred recovery. (Gabrielson-Fla)

GULF REFINING CO V DAVIS (SEEPAGE FROM A SALT WATER PIT).

80 So 2d 467-470 (Miss 1955).

Descriptors: *Water storage, *Seepage, *Mississippi, *Damages, Leakage, Reservoir leakage, Saline water, Overflow, Reservoir storage, Judicial decisions, Remedies, Pit recharge, Real property, Legal aspects, Oil wells, Encroachment, Relative rights, Leases.

Plaintiff sued defendant corporation, an oil and gas lessee, for damages to his land and timber resulting from seepage and overflow from a salt water pit and from the construction of a larger pit on plaintiff's land. Following a jury verdict for plaintiff, defendant appealed. The court held that the lessee was liable for any damages caused by his wrongful acts. Whether the seepage or overflow of salt water onto plaintiff's land was the result of defendant's negligence was a question of fact for jury. However, since the court considered the jury verdict to be excessive, the case was reversed and remanded for a new trial. (Gabrielson-Fla)

MAGNOLIA PETROLEUM CO V WILLIAMS (PROOF OF WATER WELL CONTAMINATION FROM SALT WATER DISPOSAL PIT).
76 So 2d 365-368 (Miss 1954).

Descriptors: *Mississippi, *Saline water intrusion, *Oil wells, *Water pollution, Water wells, Land tenure, Damages, Seepage, Relative rights, Oil industry, Judicial decisions, Salinity, Waste disposal, Disposal, Water quality, Water pollution sources, Water injury.
Identifiers: *Proximate cause, *Disposal pits.

Plaintiff brought this suit for damages caused to his water well by brine water intrusion. Plaintiff maintained a water well for human and animal consumption. Defendant maintained two oil wells nearby. The oil wells produced twelve barrels of salt water each day which were emptied into a disposal pit. Other salt water disposal pits were near plaintiff's well. Defendant had no control over these other wells. Any salt water contamination would have been due to the underground movement of leakage from the disposal pits. In the trial court, plaintiff recovered $1,250. Defendant appealed on the ground that proximate cause was not shown. The Supreme Court held no recovery was possible where several causes of injury were possible and some could not be attributed to the defendant. Any judgment rendered would be based on mere conjecture since the evidence was not conclusive in showing that defendant's pit contaminated the well. (Harris-Fla)

CARVER V TANNER (DISCHARGE OF SALT WATER INTO STREAM).

312 Ky 388, 227 SW 2d 905-906 (1950).

Descriptors: *Kentucky, *Oil wastes, *Saline water, *Discharge (Water), Mine wastes, Mine water, Flow augmentation, Judicial decisions, Water law, Legal aspects, Streamflow, Alteration of flow, Damages, Relative rights, Water pollution sources, Streams, Oil wells.
Identifiers: *Injunctions (Prohibitory).

Plaintiff brought action to enjoin defendant from discharging salt water into a stream which passed through plaintiff's land. Defendant was an oil producer, and the discharge of the salt water wastes was a necessary operation in his business. The court denied the injunction but awarded nominal damages to the plaintiff. The discharge by defendant at most increased the flow of the stream and caused plaintiff no material damage. When one party would be materially harmed by an injunction and the other party was not suffering material or substantial damage, the court will refrain from issuing the injunction. (Holt-Fla)
W69-07019

MCCABE V CITY OF PARKERSBURG (DUTY OF CITY TO MAINTAIN SEWERS SO AS NOT TO UNDERMINE LAND).

79 SE 2d 87-96 (W Va 1953).

Descriptors: *West Virginia, *Sewage, *Cities, *Land subsidence, Relative rights, Land tenure, Alteration of flow, Leakage, Damages, Storm drains, Judicial decisions, Legal aspects, Land, Soil erosion, Underseepage, Underground storage, Buildings, Maintenance.
Identifiers: *Lateral support, Negligence, Absolute liability.

Plaintiff sought damages in trespass for the undermining and sloughing away of her lot and settling of her dwelling. The damages were allegedly caused by defendant city's collection of water in its sewer system and by the wrongful casting of such water upon plaintiff's and adjacent land. Evidence showed a breakage of defendant's underground storm sewer which caused the damage. A circuit court jury returned a verdict for plaintiff. The Supreme Court of Appeals held that an owner of land was entitled to lateral support in adjacent land of his soil, but not for his buildings erected thereon. Any recovery for building damage must be based on negligence. The court further held the city had a duty of care in maintaining its sewage system, but not an absolute duty not to damage. The court ruled these distinctions were not adequately expressed in the instruction to the jury, and, therefore, the verdict included damages which were not recoverable. (Harris-Fla)
W69-07020

LAIRD, ROCK AND SMALL, INC V HARRY T CAMPBELL AND SONS (FLOODING DUE TO NEGLIGENT ROAD CONSTRUCTION).

92 A 2d 380-384 (Md 1952).

Descriptors: *Maryland, *Flooding, *Road construction, *Storm runoff, Ditches, Gullies, Rain water, Storms, Drainage, Storm drains, Dams, Diversion, Flood damage, Flash floods, Damages, Legal aspects, Judicial decisions, Drains, Excessive precipitation.
Identifiers: Contributory negligence.

Plaintiff sued the defendant for damages caused by defendant's negligence in constructing a road next to plaintiff's house. The road was constructed in such a manner that during a heavy rainstorm plaintiff's property was flooded and a wall of his house collapsed. The plaintiff contended that defendant was negligent in removing the topsoil of the road without providing any storm drainage and in cutting the gutter on the side of the road without

LIBRARY U. OF I., URBANA-CHAMPAIGN

providing any substitute for it. By removing these drainage devices, the flow of water onto plaintiff's land was greatly increased and the damage resulted. The court rejected the defendant's claim that plaintiff was contributorily negligent, noting that a property owner has no duty to make the wall of his house strong as a dam. The court said that if flooding is caused by the negligence of a contractor in grading a road, it was not the abutting property owner's obligation to take precautions against such negligence. The court held that although the extent of the damages caused purely by defendant's negligence could not be separated from the damages caused by the severe rain, the defendant did contribute to the damages and should be held liable for them. (Shevin-Fla)

VENTURA V CITY OF PITTSBURGH (ACCIDENT CAUSED BY ICE FORMING ON A HIGHWAY).

159 Pa Super 279, 47 A 2d 668-671 (1946).

Descriptors: *Pennsylvania, *Highways, *Ice, *Frozen ground, Drainage, Highway icing, Snow, Slush, Storms, Streams, Surface drainage, Legal aspects, Judicial decisions, Sewers, Storm drains, Grassed waterways, Damages, Accidents, Obstruction to flow, Safety, Watersheds (Divides).
Identifiers: Automobiles.

Plaintiff sued defendant city for damages resulting from an accident caused when his automobile skidded on ice on the city's streets. The highway center line was the dividing line between the city and a borough. The court said it was the city's duty to keep its half of the road free from obstructions and in a reasonably safe condition for travel. Abutting the road was a steep hill which formed a natural watershed; surface drainage flowed down the slopes in two defined watercourses. Due to the inadequacy of a storm sewer, water was not carried from the curb to the watershed. Ice formed on both sides of the highway during the winter months. The court held that the duty rests with a municipality to provide for the drainage of water which otherwise would discharge on a highway, and that, although the borough was negligent, the city was liable for its passive negligence. The court further held that it was the province of the jury to decide if ice had formed on both sides of the road. The verdict for the plaintiff was affirmed. (Shevin-Fla)

MORROW V HARRISON COUNTY (SUIT TO ENJOIN CONSTRUCTION OF A DRAINAGE DITCH).

64 NW 2d 52-61 (Iowa 1954).

Descriptors: *Iowa, *Drainage, *Ditches, *Drainage effects, Land reclamation, Drainage engineering, Channels, Drainage districts, Outlets, Sewers, Surface waters, Rivers, Streams, Silts, Construction, Storm drains, Overflow, Roads, Rainfall, Levees, Legislation, Missouri River, Legal aspects, Judicial decisions, Flow augmentation, Excessive precipitation, Remedies, Discharge (Water), Repairing.
Identifiers: Injunctions (Prohibitory).

Plaintiffs sought to enjoin construction of an open drainage ditch by the defendants. They contended that the new ditch would divert water from a river and cause an overflow which would damage their land. The defendants had determined that the ditch was necessary to drain water which had accumulated in the area due to heavy rainfall. The court held that the plaintiffs failed to prove that substantial injury would result if injunctive relief were denied. It noted that a party is not entitled to relief merely because water is sent over a more direct course to the same destination it formerly reached. It was defendants' duty to properly maintain the ditch, and it is assumed that this duty will be performed. The defendant was authorized by statute to construct the ditch, and the statute is to be liberally construed to promote reclamation of wet and overflow lands. Defendant's use of a natural stream was properly considered a repair to a drainage system. No increased volume of water will be cast upon the plaintiffs' lands. The plaintiffs were not entitled to an injunction. (Shevin-Fla)
W69-07024

ATKINSON V UNITED STATES (FEDERAL LIABILITY FOR DAM BACKWATER).

68 F Supp 99-103 (D Minn 1946).

Descriptors: *Minnesota, *Remedies, *Federal government, *Backwater, Riparian rights, Damages, Legislation, Eminent domain, Dams, Overflow, Rivers, Mississippi River, Streams, Navigable waters, Judicial decisions, Legal aspects, Flood damage, United States, High water mark, Compensation.
Identifiers: Tucker Act.

Petitioners brought claims for damages under the Tucker Act, alleging that the building of Dam No 8 on the Mississippi River and the erection of a dam on Pine Creek caused water to back-up and rise above its normal levels thus damaging plaintiffs' lands. The court determined that the claims for damages were barred by the statute of limitations. It is well settled that the government is not required to make any compensation for damage to lands by reason of the raising of a navigable river up to the ordinary high water mark. Occasional damage caused by heavy rains cannot form the basis for an action against the Government if the river, in its normal state, does not rise above the ordinary high water mark. Actions brought under the Tucker Act must be brought within six years from the date of the alleged taking. Since any taking of land would have had to occur when the waters were raised to their normal level, and since this event occurred over six years before this action was brought, no relief was available. (Gabrielson-Fla)

SEA HARBOR CORP V G AND M DREDGING CO (DAMAGES FROM DREDGING).

105 NYS 2d 497-499 (Sup Ct 1951).

Descriptors: *New York, *Dredging, *Damages, *Compensation, Channel improvement, Islands, Navigable waters, Streams, Federal government, Administrative agencies, Judicial decisions, Legal aspects.
Identifiers: *Injunctions (Prohibitory).

Plaintiff brought action for damages and injunctive relief against defendant holding company (holder of a government permit authorizing dredging operations). Plaintiff was the owner of an island, part of which had fallen into a creek due to negligent dredging operations by defendant. The court denied plaintiff the immediate injunction since defendant had ceased all dredging activity pending this suit. The court also denied a permanent injunction since the work was being done pursuant to a War Department permit. The court did award damages to the plaintiff since, even if the federal government ordered the dredging, and assuming an absence of negligence, nevertheless, under the 5th amendment of the Federal Constitution, just compensation would have to be paid. Here there was no question that defendant's dredging operations were negligently performed. Thus, there was no doubt that damages should be awarded to plaintiff. (Logan-Fla)

PURDY V CITY OF NEWBURGH (REGULATION OF RIPARIAN RIGHTS WITH RESPECT TO WATER SUPPLY).

113 NYS 2d 376-382 (Sup Ct 1952).

Descriptors: *New York, *Riparian rights, *Wate supply, *Municipal water, Water quality, Wate quality control, Pollutants, Water pollution con trol, Easements, Condemnation, Legislation Public benefits, Recreation, Lakes, Ponds Streams, Local governments, Judicial decisions Legal aspects, Relative rights, Regulation.
Identifiers: Declaratory judgments.

Plaintiffs brought action against the city for declaratory judgment regarding the parties' lega rights with reference to the application of Healt Department rules and regulations to plaintiffs riparian land. Plaintiffs' land was situated on natural stream flowing between a lake and a pond both of these bodies of water were sources of th city's water supply. The regulations in questio prohibit pollution of the stream as well as bathin or fishing in it. Plaintiffs, in a prior action, obtaine an injunction against the city preventing violatio of any riparian rights. Plaintiffs now contend tha the city must institute condemnation proceeding and obtain an easement to enforce the regulations they contend that a failure to do so will constitut an abandonment of the regulations since the rule and the possibility of condemnation constitute cloud on plaintiffs' title which has caused depreciation in property value. The court dismisse the action, holding: (1) there was no controversy between the parties; (2) the legislature must deter mine when the rules are to be abandoned; and (3 the court had power only to order payment for pro perty already taken, not order property to be taken (Kahle-Fla)

L A DARLING CO V WATER RESOURCES COMM'N (ADMINISTRATIVE REGULATIO OF POLLUTION).

341 Mich 654, 67 NW 2d 890-897 (1955).

Descriptors: *Michigan, *Pollution abatement *Adjudication procedure, *Groundwater Lagoons, Chromium, Industrial wastes, Water law Legal aspects, Judicial decisions, Administrativ decisions, Jurisdiction, Administrative agencies Public health, Water quality control, Water pollu tion sources, Water pollution control, Regulation.
Identifiers: Constitutional law, Due proces (Procedural).

Appellant discharged wastes from its electroplatin process into 2 infiltration lagoons provided by th City of Bronson. Appellee, following a conferenc with appellant in which witnesses were not sworn examined, or cross-examined, issued an orde directing appellant to install a suitable wast disposal system which would render its discharge noninjurious to public health. Appellee based it decision on the findings of its sanitary engineer wh indicated that the city's groundwater source was i danger of becoming polluted due to the conditio of the lagoons. Appellant had questioned appellee' jurisdiction over groundwater, but the court foun that the statute creating the commission also gave i jurisdiction over pollution of groundwater. Th court held the order of the commission invalid however, since the hearing afforded appellant ha violated the due process clauses of the Federal an State Constitutions. The commission could onl require the abatement of groundwater pollutio after the defendant had been given a hearing a required by law, in which he would have the oppor tunity to examine and cross-examine witnesses (Holt-Fla)
W69-07029

PETITION OF DREOSCH (PIPELINE EASEMENTS).

47 NW 2d 106-112 (Minn 1951).

Descriptors: *Minnesota, *Eminent domain, *Easements, *Pipelines, *Drainage, Ditches, Remedies, Judicial decisions, Legal aspects, Water law, Construction costs, Drainage district, Compensation, Damages, Easements, Right of way, Relative rights.

Respondent had established a county ditch to provide drainage for over 10,000 acres. Appellant owned a pipeline which would intersect with the drainage ditch in three places. Rights of way for the pipeline had been purchased from private property owners before construction was begun. In order to construct the ditch, appellant's pipeline would have to be lowered or raised at the three points of intersection. Since such action would involve substantial expense, appellant sought to recover damages in an eminent domain proceeding. Damages were awarded to appellant. The court held that an easement or right of way was 'property' within the meaning of the Minnesota constitutional provision prohibiting the taking of private property for a public use without just compensation. To force the appellant to incur the expense of raising or lowering the pipeline in order to facilitate construction of the drainage canal was tantamount to a taking of private property for a public purpose. Because Minnesota had a statute which provided for damages resulting from eminent domain proceedings, the principle of damnum absque injuria was inapplicable. (Holt-Fla)

NEWPORT HOMEWATER CO V PENNSYLVANIA PUBLIC UTILITY COMM'N PURCHASE OF PRIVATE WATERWORKS BY MUNICIPALITY).

174 Pa Super 522, 102 A 2d 221-227 (1954).

Descriptors: *Pennsylvania, *Public utilities, Water works, *Administrative agencies, Cost analysis, Water distribution (Applied), Cities, State governments, Water management (Applied), Legislation, Permits, Water rights, Economics, Legal aspects, Judicial decisions.

The Borough of Newport applied to the defendant Commission for a certificate of public convenience to enable it to purchase plaintiff water company. The plaintiff contended that the price that the defendant would be required to pay was in excess of the available assets and borrowing capacity of the borough. After a careful examination of the financial structure of the Borough, the Public Utilities Commission granted the certificate, holding that the Borough's borrowing capacity was sufficient to meet the purchase price under its construction of the statutory price formula. Acknowledging that it was within the province of the Commission to make such a determination, the court affirmed the order granting the certificate of public convenience. (Stewart-Fla)

RUTLEDGE V UNION ELECTRIC CO OF MISSOURI (RIGHT TO FLOOD CONFERRED BY DEED).

380 SW 2d 670-74 (Mo 1955) (per curiam).

Descriptors: *Missouri, *Easements, *Dams, Flooding, Flood damage, Flood water, Judicial decisions, Legal aspects, Damages, Backwater, Dam design, Reservoirs, Water levels, Water rights, Lakes, Power plants.
Identifiers: Deeds.

Landowners brought action against a power company for damages to land and personal property by reason of intentional flooding of land behind a dam. The power company defended on the ground that it possessed an easement to flood the land in question. The trial judge set aside a verdict and judgment for the landowners and entered a judgment for the power company. The Supreme Court of Missouri affirmed the decision of the trial judge on the ground that unlimited right to flood the land was granted in defendant's deed. A provision in an easement accompanying the deed which stated that the dam would be designed so as to hold the water level at approximately 660 feet above the mean sea level referred to the normal lake level and not to maximum level. Therefore, this provision in no way limited the right to flood granted elsewhere in the deed. (Watson-Fla)

HURLEY V AM ENKA CORP (REASONABLE RIPARIAN USE CONCERNING DAMS).

93 F Supp 98-103 (E D Tenn 1950).

Descriptors: *Tennessee, *Dams, *River regulation, *Competing uses, Reasonable use, Services, Ditches, Water pollution, Legal aspects, Judicial decisions, Flood control, Water control, Boundaries (Property), Riparian rights, Public benefits, Hydraulic structures, Industrial plants, Access routes.
Identifiers: Nolichucky River.

Plaintiff owned a tract of land which was divided by a shallow slough of water during part of each year. The depth of this water varied, but testimony indicated that the water was generally a few inches deep. Occasionally the slough was completely dry. The defendant constructed a dam downstream from plaintiff's land causing the water level in the river and slough to rise, inhibiting plaintiff's access to the 'island' half of his property. Defendant contended that the laws of Tennessee limited the title of a riparian owner along a navigable stream to the land above the low water mark. Consequently, defendant contended that the plaintiff had no interest in the isolated portion of his tract as it was below the low water mark. The court determined that the slough was not the low water mark of the stream and held that the plaintiff's tract had been damaged. Damages were awarded accordingly. (Katz-Fla)

Within the boundaries prescribed, taking or catching, or attempting to take or catch, any game, food, or bait fish may be done only as set forth in the State Fish and Game Code or the provisions of this article. Impeding navigation with any fishing net or device is prohibited. The interference with any fishing device being lawfully used, or its destruction without cause, and the allowance of any poison, explosive, or other deleterious substance to enter the waters described in this section, unless all practicable means of avoiding pollution have been taken is also prohibited. The provisions of this article are enforceable through arrest and prosecution by any authorized officer of New Jersey or Pennsylvania. Such arrest may be made on the waters described or on the shores of those waters if such are within the jurisdiction of either state. (Harris-Fla)
W69-07034

WATERS AFFECTED BY ARTICLE; COMMON RIGHTS TO FISH; GAME, BAIT AND FOOD FISH DEFINED.

N J Stat Ann secs 23:9-3 to 23:9-5 (1940).

Descriptors: *New Jersey, *Pennsylvania, *Sport fishing, *Bait fishing, Water law, Legislation, Public rights, Fishing, Low water mark, Fish managment, Commercial fishing, Navigable waters, Fish conservation, Bass, Sunfishes, Pikes, Trout, Sport fish, Delaware River, Legal aspects.
Identifiers: *Game fish, Trenton Falls.

The provisions in this act apply only to propagation, catching, taking, protection and destruction of fish in the waters of the Delaware River above and below Trenton Falls lying between the commonwealth of Pennsylvania and the state of New Jersey. Inhabitants of Pennsylvania and New Jersey shall enjoy a common right of fishery through the waters of the Delaware River, above and below Trenton Falls, between low water mark on each side of the river between the states, except as valid private fishing rights have been granted by either state. The term 'game fish' includes the varieties of bass enumerated by this section, the crappie, pike perch, pike, pickerel, or any form of trout. The term 'bait fish' means any species of minnows, killifishes, and stone catfish. The term 'food fish' includes all other varieties of fish. (Harris-Fla)

CONCURRENT JURISDICTION OF STATES; PROCEDURE FOR VIOLATIONS – ARREST AND PUNISHMENT OF VIOLATIONS; INTERFERENCE WITH OFFICERS; MANNER AND MEANS OF FISHING FOR GAME FISH.

N J Stat Ann secs 23:9-20, 20.1, 21 (1940), as amended, N J Stat Ann sec 23:9-6 (Supp 1968).

Descriptors: *New Jersey, *Pennsylvania, *State jurisdiction, *Sport fishing, Fishing gear, Legislation, Sunfishes, White perch, Yellow perch, Navigable waters, Shores, Fish management, Fish conservation, Legal aspects, Regulation.
Identifiers: Penalties (Criminal).

Pennsylvania and New Jersey have concurrent jurisdiction over violations of this article, within their respective jurisdictions. When Pennsylvania enacts a similar fish law any game protector, fish warden, or other person authorized, shall have the power to arrest any offender on any part of the Delaware River lying between the states or the shores thereof and to take such offender to trial in the state of the violation. The attempt to prevent an arrest by an authorized person for violation of fish laws or to prevent the carrying into effect any provisions of this article is punishable by a fine of $100. Fishing for game fish, sunfish, or white or yellow perch may only be done by methods prescribed in the state fish and game code. If no method is prescribed, only rods and lines, hand lines, or trolling lines and artificial bait may be used. The number of devices may not exceed the prescriptions in the code, or if not prescribed, 2 of 1 or the other devices named. Violators are subject to a $20 fine. (Harris-Fla)

Descriptors: *New Jersey, *Bait fishing, *Commercial fishing, *Sport fishing, Fish conservation, Fish management, Legislation, Fishing gear, Regulation, Trout, Legal aspects.
Identifiers: *Food fish, *Trenton Falls, *Fishing seasons, Penalties (Criminal).

No person may fish for bait or food fish except with devices prescribed by the State Fish and Game Code, or, if none are prescribed, with devices enumerated in this section. Any violator using a device other than those prescribed in the code or in this section subject to a fine of $20.00. The number of devices used in fishing for food fish may not exceed that number prescribed in the Code, or, if none is prescribed, 3 of 1 or the other device named. The use of a prohibited device, or the use of a legal device contrary to promulgated regulations, is punishable by a fine of $20.00. Catching food fish as prescribed by section 23:9-6 is lawful at any time of the year. Fishing or taking of game fish must be as provided in the State Fish and Game Code. Any form of trout may only be taken between April 15 and July 31 unless otherwise provided in the code. Violators are punishable by a fine of $10.00 for each fish taken. (Harris-Fla)
W69-07039

BAG LIMIT ON GAME FISH; USE OF EELPOTS AND FYKE NETS; SIZE OF CERTAIN FISH.

N J Stat Ann secs 23:9-13, 14, 16 (Supp 1968).

Descriptors: *New Jersey, *Fish conservation, *Nets, *Sport fish, Regulation, Legal aspects, State governments, Legislation, Carp, Catfishes, Suckers, Eels, Fishing gear, Legal aspects.
Identifiers: *Bag limits, *Eelpots, *Fyke nets, Fishing season, Penalties (Criminal).

The taking, killing, or possession of more gamefish than the limit prescribed by the code for one day is punishable by a fine of $20.00 for each fish in excess of the limit. The use of eelpots and fyke nets without wings during any period prescribed in the State Fish and Game Code, or, if no period is prescribed, from June 1, to July 1 is unlawful. However, it is lawful to use such devices as prescribed by the code or from July 1 to May 31 to catch carp, catfish, eels and suckers. All other fish caught must be returned unharmed immediately to the water. The device must meet the specifications of this section of the code. Violators are subject to $20.00 fine and forfeiture. No person may catch or attempt to catch fish of greater weight or less length than provided by the State Fish and Game Code or this section. Any such fish caught must be returned immediately to the water. Nothing in this section shall be construed so as to prevent fishery authorities of New Jersey or Pennsylvania from capturing fish of any size from any waters at any time of year or in any manner for purposes of propagation or stocking. Violators shall be subject to a fine of $10.00 for each fish caught and in possession. (Harris-Fla)

POWERS AND DUTIES OF COMMISSIONER OF CONSERVATION.

N Y Unconsol Laws secs 1305, 1307 (McKinney Supp 1968).

Descriptors: *New York, *Flood control, *Eminent domain, *Appropriation, State governments, Federal government, Condemnation, Projects, State jurisdiction, Cost allocation, Federal project policy, Project planning, Flooding, Easements, Administrative agencies, Compensation, Legislation, Legal aspects, Adjudication procedure, Land regulation.

The Commissioner of Conservation is authorized to supervise the state's participation in a federal flood control program. He may perform any acts necessary to carry out the authorized projects and shall conform to the regulations of the federal government. The Commissioner shall acquire by appropriation any property or interest necessary for the successful completion of the projects. Upon filing with the Department of State a description of any property necessary for a project, the officers of the state may immediately enter upon and take possession of the land. Each owner affected by the appropriation shall be served with notice and the fact that such service has been accomplished shall be recorded. An occupant of any land appropriated may be removed after proper proceedings. The Commissioner may settle claims for the value of the property appropriated, or the owner may file a claim in the court of claims. The Commissioner or his agents may enter any property for the purpose of making tests or surveys in connection with a project. (Helwig-Fla)

STRICKLAND V STATE (HIGHWAY CONSTRUCTION AND SURFACE WATER DRAINAGE).
166 NYS 2d 870-873 (Ct Cl 1957).

Descriptors: *New York, *Road construction *Drainage systems, *Prescriptive rights, Storm ru noff, Rainfall, Flood damage, Culverts, Surfac waters, Water rights, Diversion, Natural flow, Judi cial decisions, Excessive precipitation, Obstructio to flow, Discharge (Water), Legal aspects.
Identifiers: *Negligence, *Burden of proof, *Proxi mate cause.

Claimant sought to recover for damages allegedl caused when the state collected and discharge surface water upon his land from a drainage systen on a state highway. Claimant's property lay partl in the natural line of drainage and directly in lin with any overflow from the state's highway culvert After heavy rains, the culvert became plugged wit debris of unknown origin, and claimant's lan became flooded. Claimant gave no notice to th state of any defect in the culvert. The court o claims held that the state's surface water drainag course had existed uninterrupted, adverse, an under claim of right for 15 years; this being so th state was held to have acquired a prescriptive righ to maintain the drains but not to cause flooding t plaintiff's land. The court felt that since the land had previously been flooded, and since claiman had not proved negligent construction of th highways or diversion of surface waters caused b improperly constructed or plugged culverts, th claimant failed to prove negligence or a causal rela tionship. The court directed a verdict for the state (Harris-Fla)

COOPER V CITY OF READING (LIABILITY UNDER ATTRACTIVE NUISANCE DOCTRINE FOR MAINTENANCE OF DRAINAGE POOL).

392 Pa 452, 140 A 2d 792-799 (1958).

Descriptors: *Pennsylvania, *Ponds, *Drowning *Legal aspects, Safety, Hazards, Cities, Drainag systems, Storm drains, Dry beds, Ownership o beds, Easements, Barriers, Local governments, En croachment, Judicial decisions.
Identifiers: *Attractive nuisance, *Negligence *Liability, *Legal duty, Fencing, Knowledge Governmental functions.

Defendant city's storm sewer drainage systen discharged water into an abandoned canal bed forming a pool pursuant to an easement. A portio of the pool encroached upon defendant railroad' property. The pool was unfenced and childre frequently played there. One drowning had previ ously occurred. Plaintiff's children drowned when ice on the pool broke at its deepest point. The tria court granted judgment for defendant not withstanding verdicts for plaintiff. The supreme court held the attractive nuisance doctrine t apply, but felt defendant railroad did not have, no should it have had, knowledge that the pool had en croached upon its land. The city was held to have exercised sufficient control over the canal bed b exercise of its easement to fill the pool with water and had a duty to make it a safe place. The cour felt the peril presented by the illusive depth at th pool's center could not have been known by chil dren, and that the city's purpose in maintaining th unfenced pool did not outweigh the danger to th children. The court found no government functio in the passive allowance of the pool, and reinstate the verdict against defendant city. (Harris-Fla)

overnments, Permits, Regulation, Impounded vaters.

Minnesota regards all state waters which are capable of beneficial public use to be public waters subject to state control. The Commissioner of Conservation is charged with development of a water resources program. The Commissioner's duties include establishing the high water level of lakes and issuing permits to construct dams. It is a misdemeanor for any person or agency to use public waters without approval of the Commissioner. The Director of the Waters Division of the Conservation Department is required by statute to be an engineer skilled in hydraulics. The Director is responsible for physical surveys including surface and groundwater resource evaluation. Easements for the use of stoplogs to provide water project efficiency may be procured by the Commissioner. Operation of state owned hydraulic works may be assigned to local governments. Prior to diverting or draining waters, mining interests are required to obtain a permit from the Commissioner. A State Water Resources Board is to be appointed by the governor. (Katz-Fla)

WATER RESOURCES, CONSERVATION.
Minn Stat Ann secs 105.37 to 105.41 (1964_0, as amended, (Supp 1968).

Descriptors: *Minnesota, *Legislation, *Administrative agencies, *Drains, Ditches, Runoff, Surface waters, Groundwater, Base flow, Tiles, Precipitation excess, Water resources development, Hydraulic structures, Adjudication procedure, Water conveyance, Waterworks, Water supply, Water conservation, Water utilization, Legal aspects, State governments, Permits, Regulations, Impounded wastes, Dams, Reservoirs, Condemnation, Eminent domain.

Subject to existing rights, all waters capable of substantial beneficial public use are declared to be public waters subject to state control. The Commissioner shall devise a water resources conservation program contemplating conservation, allocation, and development of all waters within the state, surface and underground, in the public interest. The Commissioner shall be guided by such a program in consideration of issuance of permits for construction of dams, reservoirs, and other control structures. The Commissioner is empowered to acquire property to implement this program by condemnation. The Water Division Director shall make such engineering surveys and reports as the Commissioner shall direct. A report on all future public ditches shall be filed with the Director. The Director is required to publish runoff data and information concerning the capacity of the drains within the state. The Director is empowered to conduct inspections of manufacturing plants. The Director is authorized to appear as an expert witness on behalf of the state in any matter affecting water within the state. (Katz-Fla)

WATER RESOURCES, CONSERVATION.
Minn Stat Ann secs 105.41 to 105.45 (1964), as amended, (Supp 1968).

Descriptors: *Minnesota, *Legislation, *Administrative agencies, *Water resources development, Hydraulic structures, Dams, Adjudication procedure, Stoplogs, Reservoirs, Water conveyance, Waterworks, Water supply, Water conservation, Water utilization, Legal aspects, State governments, Permits, Regulation, Impounded waters, Eminent domain, Condemnation.

It is unlawful for any person or legal person to use or appropriate any surface or groundwaters of the state without a permit from the Commissioner. Such permits may be subject to conditions attached by the Commissioner in the public interests. Permit holders must obtain permission before increasing authorized water usage. It is unlawful for any person or the state to construct, abandon, or reconstruct any reservoir or dam without a permit from the Commissioner. The Commissioner, upon request, shall affix the natural high water mark of any public body of water. All permits required under this section shall be accompanied with specific plans, maps, and specifications concerning the proposed water appropriation. The Commissioner may, in his discretion, waive public hearing on permit applications. A disappointed party may demand a hearing within ten days from the denial of his application. Such hearings shall be public, and adequate notice of time and place shall be afforded all parties. Any issued permit is subject to cancellation in the public interest. (Katz-Fla)

Descriptors: *Minnesota, *Legislation, *Administrative agencies, *Water resources development, Hydraulic structures, Dams, Adjudication procedure, Stoplogs, Reservoirs, Water conveyance, Waterworks, Water supply, Water conservation, Water utilization, Legal aspects, State governments, Permits, Regulation, Impounded waters, Public benefits, Navigation, Wildlife conservation.

All orders of the Commissioner shall be based on findings of fact made on substantial evidence. The Commissioner shall grant or deny permit applications in furtherance of the public interest. Notice of such orders shall be served by publication or mail within 60 days after the completion of the hearing. The Commissioner shall fix the time within which all authorized construction must be completed or within which any appropriation must be completed; such period shall not exceed 5 years. Any party in interest may appeal from any determination of the Commissioner to the county district court within 30 days after notice of such order. The Commissioner, in the interest of navigation, water supply, wildlife conservation or in the general public interest may construct and maintain any waterworks necessary to maintain a uniform water level. The Commissioner is in charge of all state dams. The Commissioner may require artesian well owners to prevent wastes. Any violation of this statute is a misdemeanor. (Katz-Fla)

STOPLOGS, EASEMENTS.
Minn Stat Ann secs 105.60 to 105.71 (1964), as amended, (Supp 1968).

Descriptors: *Minnesota, *Legislation, *Administrative agencies, *Water resources development, Hydraulic structures, Dams, Adjudication procedures, Stoplogs, Reservoirs, Waterworks, Water conveyance, Water supply, Water conservation, Water utilization, Legal aspects, State governments, Permits, Regulation, Impounded waters, Public benefits.

In order to provide effective regulation of the waters controlled by the Lac Qui Parle water control project, the Commissioner is authorized to acquire, by purchase or condemnation, all easements that may be necessary for the use of stoplogs. No more than five stoplogs may be used at any one dam, and stoplogs will not be placed from freeze until 1 April of each year. The Commissioner may exercise and use easements or rights so acquired for stoplog use upon the commencement of condemnation proceedings. The acquisition costs of such easements shall be born by the water control project. The Commissioner may transfer operation of a state dam to any authorized political subdivision of the state in the furtherance of public interest. Permits allowing drainage, diversion, control, or use of waters necessary in certain mining operations may be issued by the Commissioner. Permits to mining concerns shall issue only upon a showing that no other economical and feasible mode of extraction is available and that such operations shall be in the public interest. Any permit so issued shall be irrevocable for the term thereof. (Katz-Fla)

LEGAL CONTROL OF THERMAL POLLUTION,
Max N. Edwards.
Nat Resources Lawyer, Vol 11, No 1, pp 1-6, Jan 1969. 6 p, 6 ref.

Descriptors: *Electric powerplants, *Thermal pollution, *Aquatic environment, *Water quality control, Electric power industry, Electric power demand, Thermal water, Nuclear powerplants, Heated water, Nuclear energy, Cooling, Cooling water, Water temperature, Ecology, Oxygen, Technology, Pollution, River flow, Turbulence, Water quality act, Federal government, Recreation, Permits, Legislation, Flow augmentation, Planning standards, Administrative agencies, Legal aspects.
Identifiers: *Waste heat discharge, Fed Water Pollution Control Act, Injunctions (Mandatory), Injunctions (Prohibitory).

Thermal pollution is rapidly becoming a serious problem. As the nation's need for more electric utility plants becomes greater, and the industry's use of nuclear powered generating plants becomes more widespread, thermal pollution caused by waste heat discharges becomes more prevalent. Four solutions are possible: (1) reduce the heat wasted by increased efficiency; (2) make constructive use of the heat; (3) adjust the duration of a temperature deviation; and, (4) manage the environment so as to reduce the impact of heat. Standards for water quality control do exist; however, the Federal Water Pollution Control Act does not allow for injunctive relief to abate the threatened thermal pollution. The courts expect public uses to be considered before federal licenses are granted. Several proposals have been made to create a new authority to assure compliance with water quality standards before licensing. The three major proposals are: (1) review of compliance with thermal standards by the licensing agency; (2) recommendations of standards by the Department of the Interior; and, (3) certification of compliance by the Department of Interior. Regardless of the procedure followed, thermal pollution is an immediate critical, multi-faceted problem requiring attention. This country requires abundant power, but the tapping of new power sources must be achieved with minimum pollution of our streams and rivers. (Shevin-Fla)

BRIDGE CONSTRUCTION AND MAINTENANCE.

Conn Gen Stat Ann secs 13a-90, 13a-94, 13a-99, 13a-101, 13a-112 (1958), as amended, (Supp 1968).

Descriptors: *Connecticut, *Bridge construction, *Cost allocation, *Maintenance, Artificial watercourses, Highways, Legislation, Repairing, Cities, Navigable waters, State governments, Administrative agencies, Flood control, Projects, Regulation, Bridges, Civil engineering, Cost sharing, Streams, Transportation, Construction costs, Equitable apportionment, Embankments.

Any bridge or passageway over an artificial watercourse built before May 10, 1957 and located on a highway maintained by the Commissioner of Highways shall be maintained by the owner of the watercourse. If the highway and bridge require expansion or reconstruction, the cost shall be charged to the state and the Commissioner shall thereafter maintain the bridge. Any structures or embankments to be built over or adjacent to streams in connection with state highway improvement projects and flood control shall conform to the requirements of the water resources commission for sizes and location of waterways. Towns shall, within their respective limits, build and repair all necessary highways and bridges unless the duty belongs to some particular person. Any bridge or passageway over an artificial watercourse on a highway not maintained by the Commissioner shall be constructed and maintained by the owner; however, if the town finds the bridge to have become unsafe for the traveling public, it can order the construction of a new bridge and pay an equitable portion of the reconstruction cost. No bridge without a draw shall be built across waters navigated by commercial vessels whose passage would be impeded by such bridge. (Stewart-Fla)

CONTRACTS FOR ABATEMENT OF POLLUTION.
W Va Code Ann sec 16-13-22b (1966), as amended, (Supp 1968).

Descriptors: *West Virginia, *Cities, *Pollution abatement, *Industrial wastes, Sewage treatment, Legislation, Public benefits, Water pollution, Cost allocation, Sewage disposal, Water pollution treatment, Water pollution sources, Treatment facilities, Contracts, Maintenance, Public health.

When necessary to protect public health, a municipality may contract with any industrial establishment for the operation of sewerage facilities to abate or reduce water pollution caused by industrial wastes. The industrial establishment shall periodically pay the municipality amounts sufficient to compensate it for the costs of operating and maintaining sewerage facilities. (Stewart-Fla)

GRANT V UNITED STATES (SEWAGE DISPOSAL IN TIDAL WATERS).
192 F 2d 482-486 (4th Cir 1951).

Descriptors: *North Carolina, *Sewage disposal, *Oysters, *Tidal waters, Ownership of beds, Sewage, Natural use, Chemical wastes, Federal government, Remedies, Judicial decisions, Legal aspects, United States, Leases, Legislation, Damages, Relative rights.
Identifiers: Oyster beds.

Plaintiffs leased certain oyster beds from the State of North Carolina. They brought action against the United States under a special act of Congress conferring a right of action for damage to such lands caused by the dumping of untreated sewage and laundry waste into the tidal waters in which the lands were situated. The district court entered a decree for the United States, and plaintiff appealed. This court found that the intent of the legislature in enacting the special legislation was that the United States should be held to the same degree of liability as a private person or a municipality when disposing of pollutants in tidal waters. Under state law, the rule was that there was no liability for dumping sewage into tidal waters since there was ordinarily no private ownership of lands beneath such waters. However, when the state, representing the public, leased land beneath tidal waters for the cultivation of oysters, the right of the public to dump sewage was restricted; only such sewage as would not harm the rights of the lessee could thereafter be emptied into the waters. The United States was held liable. (Gabrielson-Fla)
W69-07057

HERBERT V T L JAMES AND CO (CONDEMNATION WITHOUT COMPENSATION).

224 La 498, 70 So 2d 102-109 (La 1954).

Descriptors: *Highways, *Riparian rights, *Louisiana, *State governments, Navigable waters, Navigation, Streams, Damages, Remedies, Judicial decisions, Legal aspects, Right of way, Condemnation, Compensation, Real property, Land, Public benefits.
Identifiers: *Servitudes, Injunctions (Prohibitory).

Plaintiff owned land on a navigable stream. Across the front of this land, close to and parallel to the stream, lay a state highway. Defendants, in widening this highway, cut a road bed across plaintiff's front yard. Plaintiff sought injunctive relief and an award of damages. Plaintiff argued that defendants could not widen the highway without granting compensation for the land taken. Defendants based the legality of their actions on certain state statutes which provided that lands bordering on navigable streams owe servitudes for general road purposes without any right of compensation. The trial court issued the injunction, and defendants appealed. The court of appeals reversed, and plaintiff appealed. The supreme court, after examining the history of the statutes, reinstated the decision of the trial court. The court held that the servitude imposed by the statutes was not intended to serve any public purpose other than that incident to the nature, navigable character, or use of the stream. The decision to widen this highway was made in furtherance of other objectives. (Gabrielson-Fla)
W69-07058

CITY OF MIAMI BEACH V HOGAN (CONDEMNATION OF OCEAN-FRONT PROPERTY).

63 So 2d 493-495 (Fla 1953).

Descriptors: *Florida, *Condemnation, *Oceans, *Beaches, Recreation facilities, Atlantic Ocean, Cities, Condemnation value, Navigable waters, Parks, Recreation, Legislation, Zoning, Land use, High water mark, Low water mark, Legal aspects, Judicial decisions, Shores, Public rights, Local governments.
Identifiers: Injunctions (Prohibitory).

The city filed a petition condemning respondent's ocean front property for parks purposes pursuant to a city ordinance. Respondent filed suit attacking the reasonableness of the ordinance and sought to enjoin the city from condemning her property. The lower court held for the respondent, and certiorari was granted. The supreme court stated that a regularly enacted ordinance is presumed to be valid until the contrary is shown and that the burden of establishing invalidity rests on the complaining party. In reference to zoning ordinances, the court stated that it will not substitute its judgment for that of the city; the ordinance will be sustained unless it is shown to be clearly unreasonable. The court held that the people of a municipality have a right to use the ocean and the land lying between the high water mark and the low water mark for the purposes generally recognized. They further said that, if all the ocean front property of Miami Beach was devoted to hotel purposes, the citizens could not use the ocean unless they became a guest at a hotel. The decision of the lower court was reversed in favor of the city. (Shevin-Fla)

RIGHTS, POWERS, DUTIES; SEVERAL POLITICAL SUBDIVISIONS.

Minn Stat Ann secs 471.05, 471.06, 471.10, 471.11 (1963), as amended, (Supp 1968).

Descriptors: *Minnesota, *Legislation, *Docks, *Administrative agencies, Navigable waters, Structures, Organizations, Cooperatives, Transportation, Rivers, Inland waterways, Navigation, Excavation, Construction, Eminent domain, Con-

demnation, Abatement, Regulation, Legal aspects, Local governments.

In Minnesota, any village which has no railroad connections, is situated adjacent to navigable waters and is dependent upon such navigable waters for transportation, may combine with other towns in the vicinity to create an organization for the purpose of building, maintaining, and operating one or more docks or wharves on such waters. No such territory may organize unless when so combined it will constitute one continguous body of land. An election to determine whether to form such an organization and whether to finance it through the issuance of bonds shall be called by the various towns and villages upon petition signed by at least one per cent of the voters of such communities. Notice and conduct of such elections is regulated. If the proposition is approved by the various communities, a commission, comprised of various chief officials, shall be formed. The commission shall have the authority to purchase sites and to conduct the operation. The governing body of any political subdivision may regulate the maintenance or abandonment of dangerous excavations and may provide penalties for violations. Such installation may be defined as a public nuisance and thus be made subject to laws relating to the abatement of nuisances generally. (Wheeler-Fla)
W69-07060

ELECTRICAL.
Minn Stat Ann secs 455.11, 455.15 to 455.22 (1963) as amended (Supp 1968).

Descriptors: *Minnesota, *Easements, *Dams, Hydroelectric plants, Cities, Structures, Powerplants, Electric powerplants, Industrial plants, Electric power, Electric power production, Hydroelectric power, Water levels, Regulation, Eminent domain, Public utilities, Flow, Government finance, Pricing, Electric power rates.
Identifiers: Corporations (Public).

Any city of the third class owning and operating a power dam for purposes of generating electricity for municipal use may acquire necessary flowage rights under the power of eminent domain over and upon any property for the purposes of increasing the height of the dam. Any city situated upon a river may form a public corporation to develop water power facilities to supply electricity to the city and state institutions therein. Adjacent cities shall be invited to unite in securing the organization; however, acceptance of such invitation by the adjacent city is not a prerequisite for proceeding with formation of such corporation. The manner of organizing the corporation and its objects, purposes, election of officers, rates, and bond issuance are regulated. The corporation is empowered to acquire developed water power near the cities, to acquire necessary lands and rights, and to provide itself with suitable plants and with necessary means of distribution. (Wheeler-Fla)

LICENSES, TAKING OF GAME AND FISH.
Minn Stat Ann secs 98.45, 98.47, 98.48 to 98.52 (1947) as amended (Supp 1968).

Descriptors: *Minnesota, *Wildlife, *Permits, Fishing, Hunting, Birds, Natural resources, Administrative agencies, Local governments, State governments, Wildlife conservation, Wildlife management, Small animals (Mammals), Trapping, Furbearers, Recreation, Fish, Legislation, Legal aspects, Costs.

Except as permitted by statute, no person may take, buy, sell, transport, or possess protected wild animals without a proper license. Such license must be carried on the person of the individual while engaged in acts covered by the license. Licensing of aliens, non-residents, and non-resident students are provided for in special provisions. Certain exemptions to the licensing law are set out. The Commissioner may issue special permits for such activities as scientific expeditions, field dog trials, taking certain animals as pets and establishing, rifle ranges. The procedure for application, issuance, and revocation of licenses and permits are set out. (Helwig-Fla)
W69-07062

COMMERCIAL FISHING.
Minn Stat Ann secs 102.23 to 102.30 (1964) as amended (Supp 1968).

Descriptors: *Minnesota, *Commercial fishing, *Legislation, *Regulation, Fishing, Commercial shellfishing, Commercial fish, Fisheries, Fishing gear, Freshwater fish, International waters, Shellfish, Clams, Mussels, Fish, Rivers, Lakes, Administrative agencies, Legal aspects, Nets, Equipment, Seasonal.
Identifiers: Penalties (Criminal).

Mussels, clams, and fish, taken according to law, may be bought and sold during open seasons plus 7 days; if frozen during the season, they may be bought and sold anytime. The regulations as to the size and number of mussels allowed to be taken and as to the equipment permitted to be used in their taking are set out. The equipment and method restrictions for taking commercial fish in certain rivers and lakes are listed. No person shall knowingly obstruct or interfere with any commercial fishing operation, remove any fish from nets, or injure nets. The Commissioner of Conservation may authorize and make rules concerning the transportation, sale, and disposal of fish taken within the Red Lake Indian Reservation. (Helwig-Fla)
W69-07063

DRAINAGE SYSTEMS.

Minn Stat Ann secs 106.641 to 106.673 (1964), as amended, (Supp 1968).

Descriptors: *Minnesota, *Drainage systems, *Ditches, *Public benefits, Conservation, Drainage, Drainage practices, Flood control, Laterals, Pipes, Streams, Wildlife, Surface waters, Repulsion (Legal aspects), Legislation, State governments, Local governments, Highways, Construction, Legal aspects, Maintenance, Diversion, Obstruction to flow, Assessments, Repairing, Compensation, Ditch grass.
Identifiers: Penalties (Criminal).

Any person who obstructs or injures any public drainage system, who wilfully alters any stakes set in any drainage system or who digs without authority any drain which outlets into any public drain shall be guilty of a misdemeanor. After the construction of any ditch system, if waters are diverted from any land being assessed for such systems so that the land no longer benefits from the system, the owner of such land may petition for removal from the system. When a drainage ditch no longer benefits the public, owners of land assessed for its construction may petition for its abandonment. After abandonment of a ditch, the county shall no longer maintain or repair it. Any authority charged with determining the public utility of any drainage system will give due consideration to conservation measures. Any drainage system affecting land owned for purposes of conservation of natural resources shall be permitted to exist only if beneficial to the public interest. Ditches within a drainage system may be planted with a permanent grass. (Helwig-Fla)
W69-07064

HIGHWAYS AND PORTAGES.

Minn Stat Ann secs 163.111, 163.13 (1960) as amended (Supp 1968).

Descriptors: *Minnesota, *Highways, *Local governments, *Drainage systems, Roads, Public benefits, Legislation, Legal aspects, Relative rights, Regulation, Administrative agencies, Land tenure, Ditches.

When considering a petition for vacation of a county highway, the county board shall determine whether the lateral ditches are essential for drainage of adjacent land. If the drainage is necessary for the general health, the board may cause vacation of the highway. Any person who owns land in a county may petition for establishment, alteration, or vacation of a county highway or portage. After a hearing, the board shall, by resolution, make a determination whether to grant or deny such petition. If the petition is denied, petitioner may appeal, and there shall be a trial de novo. (Helwig-Fla)
W69-07065

BRIDGES ACROSS DIVERSION CHANNELS.
Minn Stat Ann sec 163.15 (1960) as amended (Supp 1968).

Descriptors: *Diversion structures, *Access routes, *Navigable waters, *Minnesota, Legislation, Legal aspects, Roads, Highways, Bridges, Streams, Local governments, State governments, Easements, Relative rights.

If any county diverts the channel of a navigable stream in order to improve a road, and the diverted stream crosses private property so as to deprive the owner of access to the road, such owner may grant to the county a perpetual easement across the property and the county shall build a bridge thereon. (Helwig-Fla)
W69-07066

DRAINAGES SYSTEMS AFFECTING HIGHWAYS; ALTERATIONS.
Minn Stat Ann sec 163.17 (1960) as amended (Supp 1968).

Descriptors: *Minnesota, *Highways, *Operation and maintenance, *Drainage systems, Ditches, Legislation, Legal aspects, Alteration of flow, Public benefits, Relative rights, Administrative agencies, Construction.

If it is desirable in the construction or maintenance of a highway to make a minor alteration in a public ditch system, the county board by resolution or district court by order, after a hearing, may authorize such alteration. (Helwig-Fla)
W69-07067

WITKE V STATE CONSERVATION COMM'N (TAXATION OF PUBLIC USE OF PUBLIC WATERS).
56 NW 2d 582-589 (iowa 1953).

Descriptors: *Iowa, *Navigable waters, *Taxes, *Public rights, Riparian rights, Judicial decisions, Public benefits, Administrative agencies, State governments, Permits, Boats, Lakes, Transportation, Compensation, Navigation, Water rights, Competing uses, Regulation, Legislation, Legal aspects, Financing.
Identifiers: *Constitutional law, Due process.

Plaintiff brought suit to have a state statute declared unconstitutional. The statute provided that no one could operate a commercial concession on any state-owned lands or waters without first obtaining a permit and paying an appropriate fee. Plaintiff owned several boats which he operated as taxis on the navigable waters of a lake. The state held the title to the lake waters but only in the capacity as trustee for the public. Plaintiff contended that the tax deprived a citizen of property without due process of law. The court upheld a judgment for the plaintiff, ruling that, since the waters are public, any person has a right to use the waters for whatever purpose he desired, as long as such use did not interfere with the rights of others. A state may not sell the right to use public waters.

LIBRARY U. OF I., URBANA-CHAMPAIGN

However, the court did rule that, if the state has improved the waterway or provided other facilities, a reasonable fee may be exacted in order to pay for such improvements. (Stewart-Fla)
W69-07068

KIMBLE V ANDERSON-TULLY CO (TITLE TO ACCRETION).

16 F R D 502-507 (E D Ark 1955).

Descriptors: *Arkansas, *Accretion (Legal aspects), *Riparian rights, *Islands, Mississippi River, Rivers, Navigable waters, Judicial decisions, Remedies, Legal aspects, Boundaries (Property), State governments, Riparian land.
Identifiers: *Ownership of accretion.

Plaintiff brought action to establish title to land allegedly formed by accretion. The land in question had become attached to an island which plaintiff owned. Defendant contended that the accreted land formed an independent island. Defendant filed a motion for summary judgment based on a plea of res judicata. The court denied the motion on the ground that a close and doubtful question of law was presented. No Arkansas cases were directly on point. In discussing the Arkansas policy towards accreted lands, the court noted that accretions to riparian lands are private property belonging to the riparian owners; lands which form islands in a navigable stream become, subject to a few exceptions, property of the state. (Gabrielson-Fla)
W69-07069

KIRSCHMAN V COCHRAN (TITLE TO ACCRETION).

241 SW 2d 9-13 (Mo 1951).

Descriptors: *Accretion (Legal aspects), *Land tenure, *Missouri, *Riparian land, Judicial decisions, Banks, Riparian rights, Navigable waters, Shorelines, Land forming, Legal aspects, Boundaries, Properties, Relative rights.
Identifiers: *Adverse possession, Ejectment.

Plaintiff brought action to quiet title to property and to eject defendant. The dispute concerned the ownership of lands formed by accretion. Plaintiff contended that he held title to the accretion by virtue of his title to the main land, which he had acquired by adverse possession. Defendant conceded that plaintiff had good title to the mainland but contended that such fact had no bearing on the question of ownership of accretion. The court held for the plaintiff, ruling that accretion belongs to the land to which it attaches. It follows that the title to the mainland, whether such title was acquired by deed or by adverse possession, carries with it title to any accretions. If the mainland had been unoccupied, the accretion would have been in constructive possession of the true owner; however, since the land was held by adverse possession, the accretion was in actual possession of the adverse owner. It is not necessary that the accretion be held for the statutory period required to acquire title by adverse possession. Once title to the mainland by adverse possession is obtained, title to accretion follows. (Stewart-Fla)
W69-07070

STATE V NICHOLS (OWNERSHIP OF SHORELINES AND RIPARIAN RIGHTS).

44 NW 2d 49-59 (Iowa 1950).

Descriptors: *Iowa, *Nonnavigable waters, *Riparian land, *Land tenure, Ownership of beds, Taxes, Judicial decisions, State governments, Watercourses, High water mark, Public lands, Navigable waters, Lake shores, Lakes, Riparian rights, Federal government, Land use, Real property, Legal aspects, Boundaries (Property).
Identifiers: *Quiet title.

Plaintiff brought suit to vacate a decree which quieted title to certain shore land in the name of the defendant. Plaintiff contended that the shore lands were part of the bed of a navigable body of water. Since the state holds title to the beds of all navigable waters in trust for the public, plaintiff also claimed title to the surrounding shore lands. Defendant based his claim on a tax deed. Furthermore, defendant contended that since he was in possession, had built a house, and paid all taxes on the property, plaintiff must recover on the strength of his own title and not on a defect in defendant's title. The court found the waters adjacent to the tract to be nonnavigable. Under Iowa law, an owner of riparian land bordering on a nonnavigable lake has title up to the high water mark but not to the beds. Since this is so, the court affirmed a judgment for the defendant, ruling that he had title to the shore lands. (Stewart-Fla)
W69-07071

MAYOR AND CITY COUNCIL OF BALTIMORE V CANTON CO OF BALTIMORE (RIGHT TO BUILD PIERS).

47 A 2d 775-782 (Md 1946).

Descriptors: *Maryland, *Riparian rights, *Local governments, *Ownership of beds, Navigable waters, Piers, Docks, Permits, Littoral, Navigation, State governments, Rivers, Harbors, Compensation, Judicial decisions, Legal aspects, Remedies, Damages, Accretion (Legal aspects).

Plaintiff granted permits to defendant allowing extensions of certain piers built into navigable waters, subject to inspection and minor privilege charges. When defendant did not pay these annual charges, plaintiff brought suit claiming the right to make such charges. The trial court entered judgment for defendant, and plaintiff appealed. The court held plaintiff had no right or power to exact these minor privilege charges. It found that the riparian owner possessed a vested right to make improvements on his piers. He could not lawfully be deprived of this right without his consent. Plaintiff had no right to demand compensation for the privilege of exercising that right since in this case, the power to exact compensation for the exercise of a right would have been tantamount to the power to destroy such right. (Gabrielson-Fla)
W69-07072

IN RE HADLOCK (CONSTRUCTION OF A FISHING WEIR IN A MUNICIPAL COVE).
48 A 2d 628-631 (Me 1946).

Descriptors: *Maine, *Riparian rights, *Navigable waters, *Fishing, Obstruction to flow, Ownership of beds, Recreation, Relative rights, Shores, Tides, Low water mark, Legislation, Fisheries, Tidal waters, Cities, Legal aspects, Judicial decisions, Local governments, Permits, Riparian land, Boundaries (Property).
Identifiers: *Fish weir.

Petitioner had applied to the Municipal Officers of the town for a license to erect a fish weir or trap in front of his shore in the tidewaters of a cove within the town limits. After being denied such a license, he obtained a court order directing the Officers to issue the permit. An owner of shore property bordering the cove filed a bill of exceptions. The court held that rights appurtenant to property bordering on tidal waters stop at the low water mark and that the rights intended to be safeguarded by the license requirements are those such as unobstructed navigation and fishing and not intangible rights such as unobstructed view or sightly prospects. The court held that, under the statute in question, the ruling of the lower court ordering issuance of the license was correct, and the exceptions were dismissed. (Shevin-Fla)
W69-07073

BERGER V TOWN OF GUILFORD (BEACH OWNERSHIP).

136 Conn 71, 68 A 2d 371-378 (1949).

Descriptors: *Connecticut, *Boundaries (Property), *Land tenure, *High water mark, Public lands, Beaches, Judicial decisions, Recreation, Cities, Local governments, Easements, Seashores, Highways, Public benefits, Land use, Legal aspects.
Identifiers: *Quiet title.

Plaintiff brought suit for a judicial determination of the ownership of a beach area which defendant claimed was public. A highway ran through the property parallel to the beach. Defendant claimed that plaintiff's property ended at the highway while plaintiff claimed that his title extended to the high water mark, giving him ownership of the beach. Plaintiff's predecessor in title owned to the high water mark. The existence of the highway and its related incidents did not affect property boundaries; rather, it merely provided the public with an easement to the beach after plaintiff had acquiesced in public use of his beach. Only recently had private ownership become important. The court entered a judgment upholding the title of plaintiff. The only way plaintiff could have relinquished his title to the public was by dedication. However, in order to establish a dedication, the requisite subjective intent must be established by competent evidence. The fact that the beach had established a reputation in the community as 'public' was of no consequence. The title was vested in the plaintiff. (Stewart-Fla)
W69-07074

STATE V CALDWELL (SPECIAL ASSESSMENTS TO DEFRAY DRAINAGE COSTS).

35 So 2d 642-646 (Fla 1948).

Descriptors: *Florida, *Land reclamation, *Assessments, *Financing, Taxes, State governments, Legal aspects, Conservation, Land tenure, Land development, Judicial decisions, Legislation, Experimental farms, Agricultural engineering, Watersheds (Basins), Drainage engineering, Drainage programs.
Identifiers: *Conservancy districts, *Experiment stations, *Florida Internal Improvement Fund, Writ of mandamus.

A 1919 enactment of the Florida Legislature created the South Florida Conservancy District to reclaim land for settlement. The act also provided for a special assessment (acreage tax) on land within the district to finance improvements. An agricultural experiment station was created in 1921, and placed under the supervision of the Trustees of the Internal Improvement Fund. The station was declared to be subject to the assessments. The Trustees conveyed a section of their land to the State Board of Education while it was still used as part of the experiment station and refused to pay the assessments. The Legislature responded with an act making the Improvement Fund liable for all assessments on lands used by the experiment station. The district sought a writ of mandamus to compel payment. The Trustees attacked the validity of the act. The supreme court held that the writ should issue since the experiment station was benefitting from district projects. The court distinguished general taxes from special assessments, noting applicability of the latter under the circumstances regardless of a general tax exemption. (Harris-Fla)
W69-07075

UNITED STATES V WEAVER (REGULATING USE OF GOVERNMENT RESERVOIRS).

124 F Supp 517-525 (WD Ark 1954).

Descriptors: *Arkansas, *Federal government, *Reservoir operation, *Regulation, Reservoirs, Non-consumptive use, Recreation, Boats, Fishing,

emedies, Judicial decisions, Legal aspects, Administrative agencies, Permits, Recreation facilies, Marinas, Boating, Land use, Water utilization, Use rates.
dentifiers: Department of the Army.

Defendant kept and maintained boats for rental use n a nearby government reservoir. Congress had uthorized the Department of the Army to regulate he development and operation of recreational acilities on the reservoir. Plaintiff alleged that, in iolation of Department of the Army regulations, efendant, through his sons and others, had been nd was indirectly causing boats to be placed and perated on the reservoir for a fee or profit without uthority from the Department of the Army. Plainff sought to enjoin such actions. The court held hat defendant had no legal right to conducgmeeial operation on the waters of the reservoir unless uthorized to do so by the Department of the rmy. It enjoined defendant from either directly or ndirectly causing boats to be placed or operated n the reservoir for a fee or profit. However, the ourt noted that the Department of the Army had o control over the land on which defendant perated his business and, therefore, could not egulate such rentals. Nor did the Department have he right to determine that boats rented from deendant could not be used on the reservoir. Gabrielson-Fla)

GAITHER V ALBEMARLE HOSP (OBSTRUCTION TO NAVIGABLE STREAM AS A PUBLIC NUISANCE).
235 N C 431, 70 SE 2d 680-692 (1952).

Descriptors: *North Carolina, *Public rights, *Navigable waters, *Barriers, Breakwaters, Landfills, Relative rights, Rivers, Ownership of beds, Highways, Judicial decisions, Legal aspects, Real property, Streambeds, Land use, Land forming.
Identifiers: *Deep water line, *Injunctions (Prohibitory), *Public nuisance, Estoppel.

Plaintiffs and defendant purchased land from a common vendor. The land was bounded by a navigable river as shown on recorded maps and plats. Defendants sought to construct a breakwater along the deep water line and to fill up to the line in order to construct a public park. Plaintiffs contended that such action would deprive them of riparian rights, that defendant had no title to the beds of the river, and that defendant was estopped from altering the river by virtue of the recordation of the common vendor's maps and plats on which all buyers had relied in determining property boundaries. A referee made findings of fact and law consistent with plaintiffs' claim. The supreme court held it was settled that when an owner subdivides and records plats, he dedicates all public ways, as so platted, to the use of purchasers and the public. The river, as a navigable stream, constitutes such a public way. Any unreasonable, unauthorized obstruction of navigable waters is a public nuisance. It is sufficient to constitute such a nuisance if, as in this case, navigation is rendered less convenient. The fact that the obstruction may be of public benefit does not alter its character as a nuisance. An injunction was issued to prevent the construction of the breakwater and fill. (Harris-Fla)
W69-07079

UNITED STATES V PROPERTY ON PINTO ISLAND (TITLE TO RECLAIMED AND FILLED LANDS PREVIOUSLY SUBMERGED UNDER NAVIGABLE WATER).

74 F Supp 92-106 (S D Ala 1947).

Descriptors: *Landfills, *Ownership of beds, *Navigable waters, *Alabama, Land reclamation, Land tenure, Legal aspects, Riparian land, State governments, United States, Condemnation, Compensation, EMINENT DOMAIN, Public rights, Islands, Judicial decisions, Relative rights, Littoral, Federal government, Land forming, Boundaries (Property).
Identifiers: *Dredge spoil.

In a condemnation proceeding by the United States, three parties claimed title to land on Pinto Island, including a tract of reclaimed marshland and filled land which had been artificially created. The State of Alabama claimed title based on the fact that the lands had previously been the bed of a navigable water. The United States claimed title by virtue of a deed from the State of Alabama. One Turner claimed title based on the fact that the lands were an extension of a tract purchased by him. The fill was partially due to channel dredging and the deposit of spoil by the United States. The reclamation was accomplished by Turner. In determining who should be compensated for the condemnation of the land, the district court held that since the waters covering the submerged land were not navigable in fact, no title vested in Alabama. Therefore, no title passed from Alabama to the United States under the deed set up by the United States. The court held the privileges of a littoral owner included the right to fill out to navigable waters, regardless of who accomplished the filling. Such extension carries title with it, and thus Turner's claim of title prevailed. (Harris-Fla)
W69-07080

UNITED STATES V CAVALLIOTIS (OBSTRUCTING NAVIGATION).

105 F Supp 742-745 (E D N Y 1952).

Descriptors: *Federal jurisdiction, *Navigable waters, *Navigation, *New York, Ships, Judicial decisions, Legal aspects, Water law, United States, Nonnavigable waters, Legislation, Federal government, Streams.
Identifiers: *Obstruction to navigation, Penalties (Criminal).

Defendant was charged with violating a federal criminal statute which made it unlawful for anyone to obstruction navigation by means of a sunken vessel. Defendant's 22 foot wide ship sunk in the Steinway Creek while tied to a mooring and was permitted to remain in the 250 foot wide creek for over three years before an information was filed. The court held that the evidence adduced by the government failed to prove that the creek was navigable. The court said that the true test of navigability was susceptibility of use for transportation and not actual use. It was also found that defendant's ship was not sunk so as to impede navigation as a usable width of 228 feet still remained for vessels entering and leaving the creek. Since there was no obstruction to navigation, the defendant was found not guilty. (Holt-Fla)
W69-07081

PARKER V MOORE (LOSS OF NAVIGABILITY).

262 SW 2d 891-893 (Ark 1953).

Descriptors: *Arkansas, *Navigable waters, *Ownership of beds, *Nonnavigable waters, Transportation, Mineral industry, Oil, Natural gas, Leases, State governments, Judicial decisions, Rivers, Natural flow, Alteration of flow, Navigation, Navigable rivers, Lakes, Remedies, Highways, Streamflow, Beds under water.

Plaintiff brought this suit to have a lake adjacent to his property declared nonnavigable. Such a declaration would preclude the state's right to execute oil and gas leases for the land beneath the lake. The lake had once been part of a river and served as a means of transportation for many commercial ventures. However, over 100 years prior to commencement of this action, the natural course of the river changed drastically. This change isolated the present lake and rendered it nonnavigable. The court found that the lake was no longer a useful public mode of transportation. It no longer enjoyed its previous status as a navigable waterway. Since this was so, the judgement for the plaintiff was affirmed, and the defendant was found to have no right to grant mineral leases to the land beneath the lake. (Stewart-Fla)

DALRYMPLE V VILLAGE OF RANDOLPH (RETARDATION AND ALTERATION OF NATURAL FLOW).
275 App Div 743, 87 NYS 2d 742-743 (1949).

Descriptors: *New York, *Natural flow, *Alteration of flow, *Drainage water, Routing, Judicial decisions, Obstruction to flow, Natural flow doctrine, Streamflow, Surface runoff, Surface waters, Natural streams, Cities, Local governments, Gravels, Sediments, Retardants, Flow resistance, Remedies, Damages, Water levels, Drainage.
Identifiers: Injunctions (Mandatory).

Plaintiff brought this suit to recover for damage to his land allegedly caused by certain acts performed by defendant while trying to alter the natural course of a stream. These acts by the defendant caused large quantities of gravel to be deposited in the bed of a creek which drained the waters of the plaintiff's lands. The gravel retarded the natural flow. This caused a corresponding rise in the level of the water and prevented drainage. The court held the defendant liable for the damages. However, since the defendant restored both streams to their natural condition, the court refused to grant injunctive relief. (Stewart-Fla)

STEVENS V STATE MINERAL BOARD (REMOVAL OF CLOUD FROM TITLE TO SUBMERGED LANDS).

221 So 2d 645 (La Ct App 1969).

Descriptors: *Louisiana, *Ownership of beds, *Beds under water, *Real property, Prescriptive rights, Legislation, Oysters, Bays, Streams, Lakes, Lagoons, Channels, Coasts, Lake beds, Oil industry, Administrative agencies, State governments, Boundaries (Property), Streambeds, Riparian rights, Legal aspects, Tidal waters, Inlets (Waterways).

Plaintiff brought suit to remove clouds from title of certain tidal water beds on the east coast of Louisiana. The defendant contended that the plaintiff's title to the beds was defective in light of the oyster statute which provided that all beds of rivers, lagoons, bayous, bays, and sounds connected with the Gulf of Mexico were to remain the exclusive property of the state. The court noted that the effect of the oyster statute was to unequivocally retake title to underwater beds transferred by the state to state agencies. The plaintiff's predecessors in title had derived title from the State Levee Board which had received a patent to the beds from the state. The court held that the Levee Board had been divested of title by the oyster statute before its transfer to any other predecessor and the plaintiff's derivative title was therefore a nullity. The court carefully distinguished situations where the rights of third parties had intervened before passage of the oyster statute; in such situations, there would be no divestiture of vested property rights. Summary judgment was entered for the defendant since title had reverted to the state. (Katz-Fla)

LOCAL SHELL FISHERIES.
Conn Gen Stat Ann secs 26-238 to 26-294 (1960), as amended, (Supp 1969).

Descriptors: *Connecticut, *Legislation, *Commercial shellfish, *Regulation, Fish management, Beds, Ownership of beds, Estuaries, Oysters, Clams, Mussels, Administrative agencies, Local governments, Permits, Tidal waters, Cultivation, Wildlife conservation, Fisheries, Bridges, Navigable waters, Streams, Boundaries (Property), Proprietary power, Legal aspects.

The selectmen of any town may appoint an oyster committee of not more than five electors of such town. The committee shall designate suitable places in the navigable waters within the jurisdiction of the town for planting or cultivating oysters, clams or mussels. Any individual desiring to cultivate oysters, clams, or mussels, may apply to the committee or to the authorized selectmen to designate a suitable place within the town's jurisdiction for that purpose. No such designation is effective until after a public hearing is held by the committee at which parties in interest and citizens may be heard. The applicant must provide the committee with a certificate from the town clerk stating that the ground has not previously been designated and is properly within the jurisdiction of the committee. Evidence of the committee's designation is to be recorded with the town clerk. The county court of common pleas may order lost and uncertain boundaries to be erected and established upon petition of an aggrieved party. This statute sets forth comprehensive prohibitions relating to the ways in which oysters may be taken. (Katz-Fla)
W69-07202

LOCAL SHELL FISHERIES.
Conn Gen Stat Ann secs 26-238 to 26-248 (1962), as amended, (Supp 1969).

Descriptors: *Connecticut, *Legislation, *Commercial shellfish, *Ownership of beds, Beds, Fish management, Estuaries, Oysters, Clams, Mussels, Administrative agencies, Local governments, Permits, Regulation, Tidal waters, Cultivation, Wildlife conservation, Fisheries, Bridges, Navigable waters, Streams, Boundaries (Property), Proprietary power, Legal aspects.

A designation by the committee shall consist of a written description of the ground by ranges or otherwise. All monies derived from such a designation shall be paid to the town. Any owner of ground previously designated and recorded by the town clerk may apply to have the ground redesignated to him should the evidence of that recording be lost. The court of common pleas for the appropriate county may appoint a committee of not more than three disinterested property owners to ascertain lost and uncertain boundaries. The court shall also entertain petitions from aggrieved parties seeking the return of natural beds to the public domain should such a bed be improperly granted. If such a bed has been improperly, but in good faith, staked-out, the court may grant the occupant a reasonable time to remove improvements and seeded oysters. (Katz-Fla)
W69-07203

LOCAL SHELL FISHERIES.
Conn Gen Stat Ann secs 26-249 to 26-251 (1960), as amended, (Supp 1969).

Descriptors: *Connecticut, *Legislation, *Commercial shellfish, *Ownership of beds, Fish management, Beds, Estuaries, Oysters, Clams, Mussels, Administrative agencies, Local governments, Permits, Regulation, Tidal waters, Cultivation, Wildlife conservation, Fisheries, Bridges, Navigable waters, Streams, Boundaries (Property), Proprietary power, Legal aspects.

Each person who cultivates oysters, clams, or mussels in a lawfully designated place shall own the oysters so seeded as well as all oysters naturally found there. Such person shall have the exclusive right to take up and dispose of such oysters, clams, or mussels. However, the rights of any owner of lands in which there may be salt water creeks or inlets, or which may be contiguous to navigable waters, shall not be affected by the forgoing. The committee is prohibited from enclosing any natural oyster or clam bed and from infringing upon the free navigation of such waters. Shellfish grounds not within exclusive jurisdiction shall be taxed by towns in the same manner and to the same extent as real property and no other tax will be levied on such a franchise. (Katz-Fla)
W69-07204

LOCAL SHELL FISHERIES.
Conn Gen Stat Ann secs 26-251 to 26-258 (1960), as amended, (Supp 1969).

Descriptors: *Connecticut, *Legislation, *Commercial shellfish, *Ownership of beds, Estuaries, Oysters, Clams, Mussels, Administrative agencies, Local governments, Permits, Regulation, Tidal waters, Cultivation, Wildlife conservation, Fisheries, Bridges, Navigable waters, Streams, Boundaries (Property), Proprietary power, Legal aspects.

Hard or round clams shall not be taken by a rake, tongs, or dredge unless such device has a space of more than one inch between its prongs. Clams less than one inch in thickness are not to be sold and are to be returned immediately to the water. Any person who trespasses upon designated ground shall be guilty of a misdemeanor. Any person who catches shellfish growing on or appurtenant to any bridge without written consent of the owner shall be fined. Plowing for shellfish is prohibited along Long Island Sound. Any person who injures the dams or gates of an oyster pond shall be fined. The superior county court, on application of the Oyster Committee, shall appoint three disinterested persons to ascertain, locate, and describe all the natural oyster, clam, or mussel beds within the boundaries of any town. These appointees will hold public meetings at which such determination shall be made. The findings made at such meetings shall be submitted to the court in the form of a report. (Katz-Fla)

COMMERCIAL FISHERIES.
Conn Gen Stat Ann secs 26-142 to 26-186 (1960), as amended, (Supp 1969).

Descriptors: *Connecticut, *Legislation, *Fish, Commercial fishing, Commercial fish, Commercial shellfish, Fisheries, Fish management, Administrative agencies, Fish conservation, Permits, Regulation, Wildlife conservation, Nets, Fyke nets, Gill nets, Trawling, Trapping, Legal aspects.

The use of nets or devices in the inland waters of Connecticut is prohibited without registration with the board. Any person operating or tending a registered net or device must obtain a permit from the board. The statute sets forth a comprehensive list of fees charged for registration of nets. The required fee is determined on the basis of the type of net involved and the variety of fish to be taken with the net. The inland waters within which lawful nets may be used is determined by the board. The specifications and dimensions of such nets and commercial fishing gear, as well as the fishing seasons, are determined by the board. Every state licensee impliedly consents to inspection of his license and catch. All commercial fish hatcheries must be licensed by the state and are subject to periodic inspection. Fish preserves may charge a fee for taking fish from waters within their control and persons so engaged need not have a sport fishing license. All commercial fishing vessels must be registered withe board, and all persons operating or assisting on such vessels must be licensed by the state. (Katz-Fla)
W69-07207

COMMERCIAL FISHERIES.
Conn Gen Stat Ann secs 26-142 to 26-147 (1960), as amended, (Supp 1969).

Descriptors: *Connecticut, *Legislation, *Fish, Commercial fishing, Commercial fish, Commercial shellfish, Fisheries, Fish management, Administrative agencies, State governments, Fish conservation, Permits, Regulation, Wildlife conservation, Nets, Fyke nets, Gill nets, Trawling, Trapping, Legal aspects, Herrings, Eels.

All fyke, trap or pound nets are required to be buoyed and clearly marked with the license number of the owner in black numerals on a light background. All gill nets and seines shall have a metal registration tag attached. Tomcod and frost fish may be taken only by net constructed of twine or wire with mesh greater than three quarters of an inch and approved by the board. Smelt may be taken for commercial purposes only by registered nets, tended or operated by licensed persons. The board may extend the open season on smelt for as long as 7 days whenever adverse weather defers the smelt run. A permit is required to set an eel pot and any person using an eel pot must be licensed. No person shall take shad by using a net of less than 2 1/2 in. stretched mesh. The taking of shad is prohibited except during seasons determined by the board. During such seasons, shad may not be commercially taken on weekends. The taking of shad in any marine district is subject to the same regulations as in inland districts. (Katz-Fla)
W69-07208

COMMERCIAL FISHERIES.
Conn Gen Stat Ann secs 26-147 to 26-186 (1960), as amended, (Supp 1969).

Descriptors: *Connecticut, *Legislation, *Fish, *Commercial fishing, Commercial fish, Commercial shellfish, Fisheries, Fish management, Administrative agencies, State governments, Fish conservation, Permits, Regulation, Wildlife conservation, Nets, Fyke nets, Gill nets, Trawling, Trapping, Crabs, Lobsters, Fertilizers.

The board may permit any person to use a net for taking shad in the Connecticut and Farmington Rivers. Commercial hatcheries must be licensed and every license must be renewed annually. All commercial fishing vessels must be registered and crewmen must be licensed. Drag nets over thirty feet in length must be registered and their operators licensed. The bowl of any weir or other device must be constructed of net with a stretch mesh of at least two inches but this does not apply to fyke nets used for catching herring or bony fish. The board may designate certain areas of water in or near stream mouths or estuaries within which use of certain nets will be prohibited. No person is permitted to render any food fish into oil or fertilizer. Size limitations on crabs, lobsters and sturgeon offered for commercial purposes are to be strictly enforced. Each holder of a commercial fishing license must make an annual report disclosing the number and value of boats, nets, and devices used by him and the number, weight and value of the species of fish or lobsters caught by him. (Katz-Fla)

Connecticut assents to Public Law 681 of the United States which offers aid to the states in fish restoration and management projects. The State Board of Fisheries and Game is directed to perform such acts as necessary to conduct and establish cooperative fish restoration projects, in accord with the guidelines set forth by the Secretary of the Interior. All funds accruing to the state from license fees paid by fishermen, hunters, and trappers shall be appropriated exclusively for the development of such fisheries The Board is authorized to acquire, by purchase, lease or otherwise, hunting and fishing rights on any land or water within the state. The Board shall determine the seasons during which these management lands shall be open and shall determine the bag limit permissible thereon. The Board may supply hunting facilities at a reasonable fee for use on these lands. The Board shall act in cooperation with the Department of Agriculture and Natural Resources in preserving and protecting the tidal wetlands of the state. (Katz-Fla)

Identifiers: Penalties (Criminal), Penalties (Civil).

An appointed board of five members, serving without compensation, enforces all state laws relating to wildlife, fish, crustacea, game and nongame birds, water-fowl and game and fur-bearing animals. It has all powers necessary to carry out its duties and may bring actions in court to enforce laws promulgated by the board. Areas of responsibility include: (1) introduction, securing, and distribution of fish and game suitable for the state; (2) designation of closed fishing areas; and (3) taking of any animal for scientific purposes. The board has jurisdiction over all fish and game belonging to the state and may regulate hunting, fishing, and trapping on state land. The board may acquire land for establishment of fish hatcheries or game preserves. It may grant easements to the United States Government or any state subdivision with the approval of the attorney general. The board may construct and maintain rearing ponds for fish and may distribute these fish in state waters. It may destroy any undesirable or diseased species. It may enter into cooperative agreements to promote wildlife research and training with federal or local governments and private groups. It may acquire easements needed for maintenance of state owned dams. (Johnson-Fla)

The Director of the Department of Natural Resources is responsible for preparation and administration of a comprehensive program for the conservation of natural resources. The Director may execute agreements in the name of the state, conduct research in improved conservation, investigate the habits of wildlife, and fix or suspend hunting seasons. The Director also has the authority to designate necessary localities for the perpetuation of any species of wildlife. The Director may enter private lands in order to conduct surveys and inspections and may make arrests to enforce the provisions of this act. The Director may purchase and acquire land for state forests, parks, and recreation areas, for public hunting, trapping and fishing grounds, and for fish hatcheries, game farms, wildlife research areas and feeding stations. The Director is further empowered to sell oil, gas, timber, minerals, sand, and gravel on state lands and is responsible for the protection of forests from fire. The Director will represent the interests of the state under provisions of applicable federal acts. The Director shall study the land and water boundary areas of the state for development, conservation, and use of water, forests, minerals, and wildlife. (Kelly-Fla)

STATE V LANZA (DELEGATION OF THE EMINENT DOMAIN POWER OF THE STATE).
27 N J 516, 143 A 2d 571-581 (1958).

Descriptors: *New Jersey, *Eminent domain, *Condemnation, *Legislation, Water resources development, Water supply, State governments, Relative rights, Land tenure, Damages, Administrative agencies, Public rights, Judicial decisions.
Identifiers: *Delegation of legislative power, *Constitutionality.

Pursuant to an enabling act, the New Jersey Commissioner of Conservation and Economic Development was authorized to acquire land in the Round Valley area for use in the future establishment of a water supply system. Acquisition was authorized by purchase or exercise of eminent domain. The State of New Jersey attempted to acquire defendant's land for public use, but no purchase price could be agreed upon. Defendant claimed that the enabling act was an unconstitutional declaration of power. On appeal from a judgment appointing commissioners to assess damages sustained by the taking, the Supreme Court held the legislature could constitutionally appropriate money to reimburse municipalities for lost tax revenues and relocation of roads. The court further held it constitutional for the legislature to delegate the power of eminent domain since although the power is exclusively legislative, the legislature cannot directly supervise each exercise of it. By defining the general, appropriate and necessary public need, and delegating acquisition of the land, the legislature had not demonstrated improper motive or arbitrary and capricious abuse necessary for judicial review. The decision was affirmed. (Harris-Fla)

STEPHENS V STEWART (VICARIOUS LIABILITY FOR NEGLIGENT MOTORBOAT OPERATION).

165 SE 2d 572-577 (Ga Ct App 1968).

Descriptors: *Georgia, *Boating, *Hazards, *Navigable waters, Legal aspects, Admiralty, Legislation, Administrative agencies, Federal government, State governments, Regulation, Judicial decisions, Recreation, Water sports, Swimming, Safety.
Identifiers: *Family purpose doctrine, *Vicarious liability, *Motorboat numbering act, *Civil liability, Retroactive legislation, Wrongful death action.

Plaintiff brought suit for wrongful death against the father of a 13 year old girl who struck and killed a 16 year old boy while operating a motorboat. The trial court entered judgment for plaintiff under the theory of respondiat superior. The court of appeals, in reversing the lower court, held that the act extending the 'family purpose' doctrine to watercraft was not retroactive, since it altered substantive rights, and did not apply to the case at hand. The court further held the power delegated to the Game and Fish Commission under the motorboat numbering act did not extend to a creation of civil liability for motorboat owners, even where the Legislature had approved the Commission's regulations. The court refused to consider a complaint based upon admiralty law and federal statutes dealing with watercraft operation on navigable waters, since the lake in question (Lake Lanier) had been held not to be navigable waters of the United States in a federal district court action. (Harris-Fla)

STATE V GILL (TITLE TO ARTIFICIAL ACCRETION).

66 So 2d 141-146 (Ala 1953).

Descriptors: *Alabama, *Riparian rights, *Landfills, *Accretion (Legal aspects), Littoral, Federal government, State governments, Riparian land, Remedies, Bays, Reclamation, Channels, Dredging, Channel improvement, Boundaries (Property), Shores, Navigation, Navigable waters, Ownership of beds, Judicial decisions, Legal aspects.

The federal government, while engaged in constructing a navigable channel, deposited some of the material dredged out of the channel along the shoreline of respondent's property, creating an artificial, manmade accretion. The state filed a bill to quiet title to the accreted land. Respondent answered, alleging that he possessed the title to the property and praying for general relief. The circuit

ourt held that title to the land was vested in espondent, and complainant appealed. The court, vhile making some procedural modifications, af-irmed the decision of the lower court. After ex-mining the relevant authorities, the court found hat the governing rule of law was that where accre-ion to the shore was caused by legitimate actions f the federal government, such accretion belonged o the littoral owner rather than the state. While the tate has title to the beds of navigable waters, this is itle to the beds as beds, not to the individual grains f sand or lumps of mud that constitute the land naking up the beds. Consequently, the state has no itle when the bottom is pumped up to create new and. The manmade land being added to the pro-erty of the riparian or littoral owner becomes the roperty of such owner. Identifiers: Quiet title suit, Adverse possession.

Plaintiff brought this suit to quiet title to accreted nds held under a tax deed. Defendant cross-laimed to quiet title to the land in himself. The rial court granted judgment for defendant, and laintiff appealed. Both parties trace their title to a ommon owner. The accretions in question were ocated on the east side of a stream. By a tax deed, laintiff acquired title to land along the west side of he stream. Defendant claimed title to accreted nds along the stream under deeds purporting to onvey all land east of the stream. Defendant had lso paid taxes on the accreted lands for 15 years. laintiff based his claim on the general rule that a onveyance of riparian land carries with it all ccretions accumulated thereon. Defendant laimed that there was a severance of plaintiff's riginal riparian lands from the accreted lands in uestion. The court affirmed a judgment for the de-endant, basing their decision on the fact that de-endant's title purported to convey all land east of he stream. In addition, defendant had paid taxes or 15 years on the accreted lands, thus severing laintiff's riparian land from the accretions. The ourt noted that plaintiff was entitled only to the ccretions on the west side of the stream. (Holt-la)

Plaintiff's predecessor in title had constructed a ike along the bank of a stream in order to exclude tide waters from a portion of plaintiff's land. Plaintiff acquired title to the reclaimed lands through the previous title holder. Upon application by the State Highway Department, a riparian grant was issued to the state without notice to the plaintiff. Plaintiff sought to set aside the grant and to have a judgment of title in his favor. The superior court held that mere reclamation or improvement of land between the low and high water marks vested title in the shore owner under the state's 'Wharf Act.' The court further held that the repeal of the Act did not affect plaintiff's title. However, the court held that erosion along tidal waters extended the state's domain by natural means and revested title in the state. The dike no longer preserved plaintiff's title, and the grant to the State Highway Department was valid. The court felt that the state could retain its own title to land under water without notice to riparian owners. However, in dicta, the court said a grant to an individual must be subject to the preemptive rights of the riparian proprietor to have notice. A judgment was entered for the defendant. (Harris-Fla)

BRINDLEY V BOROUGH OF LAVALLETTE (VALIDITY OF CITY ORDINANCE REGULATING BEACH).

33 N J Super 344, 110 A 2d 157-168 (1954).

Descriptors: *New Jersey, *Legislation, *Boundaries (Property), Riparian land, Atlantic Ocean, Cities, Recreation, Easements, Public rights, Swimming, Beaches, Fishing, Legal aspects, Relative rights, Tidal waters, Surveys, High water mark, Low water mark, Judicial decisions.
Identifiers: *Pre-emptive rights, *Adverse user, Dedication, Due process (Substantive).

Beach front owners sued to test the validity of a city ordinance establishing a paid bathing beach which prohibited use by non-residents. Plaintiffs asserted that the city was not owner of the ocean front. Plaintiffs asserted that their properties abutted a street contiguous with the ocean front, and their titles extended to the high water mark, entitling them to riparian rights. Therefore, plaintiffs contended that the ordinance in question deprived them of their property rights. The court held the ordinance invalid as discriminatory against non-residents. The court observed that plaintiffs' deeds referred to a recorded map which described plaintiffs' lots together with intersecting streets, and, since this was so, the selling of the lots by plaintiffs' grantor amounted to a dedication of these streets. The court declared that plaintiffs owned to the center line of the street because the dedication was not formally accepted by the city nor impliedly accepted by public use. However, the street was subject to dedication when the city desired to accept it. The court stated that since the mean high water mark never reached the street's center line, plaintiffs were not littoral owners with a pre-emptive right to a riparian grant. The court held the ordinance valid, except for the discriminatory provisions, since a state statute authorized the city to regulate beaches acquired for recreational purposes. (Reed-Fla)

ANDERSON V DE VRIES (RIGHT OF WAY AND ACCESS OVER LAND TO A BEACH).

93 NE 2d 251-256 (Mass 1950).

Descriptors: *Massachusetts, *Right-of-way, *Beaches, *Access routes, Legal aspects, Land tenure, High water mark, Real property, Easements, Sea walls, Judicial decisions, Low water mark, Boundaries (Property), Roads, Swimming, Recreation facilities.
Identifiers: *Custom and usage.

Plaintiffs seek a determination of a right of way and a designation as to beach area available for their use as lot owners in the vicinity of the beach. Defendants owned land separating plaintiffs' lots from the beach and over which the alleged right of way extended. Plaintiffs' deeds provided, by means of a uniform clause, for a right of way to the beach, and prior to a conveyance to the defendants, it had been the custom of plaintiffs to use a 12 foot wide road to approach and make full use of the beach for sunbathing and swimming. Reviewing a decree by the Land Court, to which defendants filed exceptions, the Supreme Judicial Court held that defendants took no better title than their grantors, who had acquiesced in the use of the road and beach, and that although the right of way specified in the deed was indefinite, the one customarily used had implicitly replaced it. The Court held a 'beach' to be the land above the high water mark and defined by some natural or artificial sea wall or boundary which provides convenient and safe access to the water. Although not explicit in the deed, the court ruled the right of way included use of the entire beach--not merely an area equal to the width of the way. (Harris-Fla)

DAVIS V MORGAN (OWNERSHIP OF SUBMERGED LAND AND ACCRETION).

228 N C 78, 44 SE 2d 593-597 (1947).

Descriptors: *North Carolina, *Accretion (Legal aspects), *Land tenure, *Dredging, Legal aspects, Navigable waters, State governments, Legislation, Beds, Islands, Judicial decisions, Boundaries (Property), Real property.
Identifiers: *Jury instructions.

Plaintiffs brought action to establish title to certain property and to restrain defendant from trespassing thereon. Plaintiffs claimed title to land under an 1853 grant conveying land which was, at that time, either an island, a marsh or a shoal--partially submerged. Defendant contended that plaintiffs' grant was void as an attempt to convey land covered by navigable waters in violation of state law (G S 146-1). Defendant further claimed title to the land under a grant from the state in 1937. The superior court held for the plaintiffs. On appeal, the Supreme Court held that the following charge was not erroneous: 'Accretion is the increase of real estate by the gradual deposit by water of solid material...so as to cause that to become dry land which was before covered by water,...The doctrine of accretion does not apply to land reclaimed by man by filling in land once under water and making it dry.' The issue was whether accretion or dredging had caused additions to the tract in question. The court reversed the lower court on the basis of an erroneous exclusion of certain evidence and ordered a new trial. (Harris-Fla)

LIBRARY U. OF I., URBANA-CHAMPAIGN

Plaintiff brought suit for recovery of lands and damages for trespass to certain riparian lands which he claimed he was the owner. Defendant denied plaintiff's title to the land. Plaintiff had conveyed certain lands to the defendant. The lands as defined on the map included the riparian land. The plaintiff contended that he did not convey the riparian land since that land had been gradually built up through accretion. The court held that conveyance by the plaintiff, without reservation, vested ownership of land bordering on the waterway in the defendant with riparian rights incident to the ownership. The court held that the owner of riparian land acquires title to all extensions of his land by accretion and loses title to those lands that are washed or eroded away. The court held that the plaintiff had failed to show that title vested in him and granted judgment for defendant. (Shevin-Fla)

CITY OF TACOMA V TAXPAYERS OF TACOMA (STATE COURTS PRECLUDED FROM CONSIDERING ISSUES DECIDED BY FEDERAL COURTS).

357 U S 320-342 (1958).

Descriptors: *Federal government, *Federal Power Act, *Federal jurisdiction, *Federal-state water rights conflicts, Legal aspects, Water rights, Hydroelectric project licensing, Cities, State jurisdiction, State governments, Navigable rivers, Pondage, Water resources, Hydroelectric plants, Dams, Stream fisheries, Electric powerplants.
Identifiers: United States Supreme Court, Delegation doctrine, Due process, Commerce power.

Plaintiff city was granted a license by the Federal Power Commission, over objections of the State Attorney General, to construct a series of power dams over navigable rivers. Some of these dams were to be built on state-owned lands, and one would cause inundation of a state fish hatchery. The state appealed the Commission's order to the Federal Circuit Court of Appeals which upheld the order. The city brought suit, under the license, to obtain a state superior court order allowing the city to issue revenue bonds to finance the project. The state intervened asserting the same grounds that had been rejected by the Power Commission and the federal court. The state superior court ruled in favor of the state, and the state supreme court affirmed. The city obtained certiorari to the U S Supreme Court which reversed the decision of the state courts. The state's contention that the city could not exercise federal eminent domain power to take state property was rejected. The city's license and right to take the state lands in question were a valid delegation of the Federal Power Commission's exclusive dominion over the navigable waters of the United States. The state's ability to appeal Power Commission orders unfavorable to it has been prescribed by federal statute. The federal court of appeals' decision favoring the Commission was final under federal law, and the state could not, in a later state court action, question the city's power to take state lands under its federal license. DYE V UNITED STATES (WRONGFUL DEATH ACTION FOR NEGLIGENCE IN DAM MAINTENANCE).

210 F 2d 123-129 (6th Cir 1954).

Descriptors: *United States, *Warning systems, *Accidents, *Dams, Boating, Kentucky, Administrative agencies, Federal government, Judicial decisions, Legal aspects, Ohio River, Control structures, Dam design, Engineering structures, Damages, Navigable rivers, Navigable waters, Operation and maintenance, Flow augmentation, Regulation.
Identifiers: *Negligence, Corps of Engineers, Coast Guard, Wickets.

Plaintiffs brought these wrongful death actions against the defendant as a result of drownings which occurred when two small boats were pulled over a dam by the force created when the dam's wickets were left open. Plaintiffs alleged negligence on the part of the Coast Guard and the Corps of Engineers in permitting the wickets of the Ohio River Dam to be open without adequate warning and without suitable protection for river travelers. The dam was owned by the United States, and the Corps of Engineers was responsible for its maintenance and operation. Upon hearing evidence which included testimony that two signs warning of the dangerous condition were prominently displayed, the trial court dismissed the complaints. The appellate court reversed, directed verdicts for plaintiffs, and remanded for a determination of damages. The court held that the evidence was sufficient to establish negligence by the dam operator in failing to give adequate warning of a dangerous condition and failure of the Government to use protective measures for the benefit of navigators. The court noted that the area Coast Guard observer failed to warn boats after being instructed as to when the wickets would be lowered. (Wheeler-Fla)

TOOMER V WITSELL (CONSTITUTIONALITY OF STATE REGULATION OF SHRIMPING IN 3 MILE MARITIME BELT).

334 U S 385-410 (1948).

Descriptors: *Commercial fishing, *Regulation, *Shrimp, *State governments, Legal aspects, South Carolina, Legislation, Permits, Taxes, Relative rights, Fish migration, State jurisdiction, Judicial decisions, Fish management, Fish conservation, Fish harvest.
Identifiers: *Maritime belt, *Constitutionality, *Injunctions (Prohibitory), Privileges and immunities clause, Police power, Commerce clause.

Fishermen (residents of Georgia) sought to enjoin enforcement of South Carolina statutes governing commerical shrimping for migratory shrimp within the 3 mile maritime belt off the coast of South Carolina. The district court refused to issue the injunction. The Supreme Court held that the state had sufficient interest in preserving the natural resources of the state to sustain the regulation of shrimping in the maritime belt as a reasonable exercise of the state's police power. The court upheld a tax on shrimping but found two exercises of the power unconstitutional. An imposition of license fees 100 times greater for non-residents than for residents was violative of the privileges and immunities clause since the state could not justify the discrimination as necessary for conservation of shrimp. The Court denied the state 'owned' the shrimp, since they were migratory. A statute requiring unloading, packing, and tax stamping of all shrimp caught in the maritime belt to be done in South Carolina ports was held violative of the commerce clause. The Court held that the state could prohibit shrimping completely; however, if it chose not to do so, it could not excessively burden interstate commerce by imposing rigid economic patterns after such shrimping occurred. BUILD PIER AS MEMORIAL TO SAILORS AND SOLDIERS.

N J Stat Ann secs 40:179-106 through 40:179-108 (1967), as amended, (Supp 1968).

Descriptors: *New Jersey, *Piers, *Recreation facilities, *Parks, Social aspects, Seashores, Ownership of beds, Oceans, Coasts, Littoral, Atlantic Ocean, Piles (Foundations), State jurisdiction, Public benefits, Legislation, Public lands, Tidal waters, Financing.
Identifiers: Notice, Due process.

This statute, passed in 1924, allows any oceanside city to make permanent use of the state's tidewater lands for the purpose of constructing a 'victory pier' in memory of the nation's soldiers and sailors. The pier must be a part of an area set aside for a public resort or as a public park. Such pier may be paid for under any reasonable method the common council of the city, with the assent of the public, may choose. The piers may not extend more than 3,000 feet outward from the oceanside boundary line of the public area, and such piers shall be considered part of the public area. The statute establishes notice requirements which must be followed in the event the common council of any city intends to pass an ordinance authorizing a 'victory pier.' All parties interested in such an ordinance must be given an opportunity to be heard. (Blunt-Fla)

Identifiers: Options.

Plaintiff sought a judicial declaration of his rights in certain offshore tidal lands. The plaintiff calimed title under an 1869 statute, the United Companies Act, which authorized the plaintiff's predecessor in title to fill the lands in question. The plaintiff bought the lands from its predecessor in 1955. Neither the plaintiff nor its predecessors ever made any attempt to improve the lands as stipulated. The defendant denied that the 1869 act conveyed anything more than a revocable license which the state impliedly revoked by granting the defendant's license to dredge in the area. This court held that guardianship of tide-flowed lands below the high water line is in the legislature and therefore is subject, by statute, to an express grant of a freehold, or any lessor, estate, to any grantee, regardless of whether he is the owner of the lands above the high water mark or not. The 1869 act created a revocable license in the plaintiff's predecessor, a mere personal privilege which was revocable at law, at the licensor's pleasure, even though substantial sums had been paid in consideration of the license. When no time is fixed for performance under a contract or option, a reasonable period is intended, and where there has been no performance for 88 years, such option becomes unenforceable and the holder may lose his inchoate right to the land. NORTH COUNTIES HYDRO-ELECTRIC CO V UNITED STATES (HYDRO-ELECTRIC PLANTS).

151 F Supp 322-324 (Ct Cl 1957).

Descriptors: *Illinois, *Hydroelectric plants, *Flood damage, *Ice jams, Flood protection, Flood forecasting, Flood control, Ice, Ice breakup, Dams, Dam design, Power plants, Legal aspects, Reservoirs, Reservoir storage, Rivers, Judicial decisions.

Plaintiff owned and operated a hydro-electric power plant on the Fox River in Illinois. He brought suit against the United States for an alleged taking of his plant. Plaintiff had brought an identical suit against the United States 10 years earlier. In both cases, plaintiff's theory was that the United States, by erecting a dam on the Illinois River, created a condition which caused large ice jams to form below plaintiff's dam. This condition so impeded the flow of the Fox River as to cause flooding of plaintiff's power house, thereby halting its operation. The United States interposed the defense of res adjudicata. The court sustained this defense, holding that every element of plaintiff's cause of action had been finally adjudicated in the earlier proceedings between the parties. (Carruthers-Fla)

Descriptors: *Florida, *Easements, *Riparian rights, *Accretion (Legal aspects), Judicial decisions, Water law, Boundary disputes, Relative rights, Boundaries (Property), Lakes, Ownership of beds, Scenic easements, Easements, Legal aspects.
Identifiers: Implied easements, Injunctions (Prohibitory).

Plaintiffs requested a declaratory judgment regarding their rights in respect to land and waters adjacent to a lake owned by defendants. A plat map of the area in question showed that plaintiffs' rest home originally was separated from the lake only by a walkway circling the lake. The lake had receded in recent years, however, leaving the edge of the path between 70 and 80 feet from the lake. Plaintiffs asserted that they retained an implied easement for use of the land adjoining the lake, although the walkway was some distance from the water. The court found that the original subdividor of the property had intended that plaintiffs retain use of the land adjoining the lake, and that this easement extended to the present lake margin. In Florida the margin of a body of water constituting a boundary generally continues to be the boundary regardless of reliction or erosion. Since the defendants owned the lake bed, plaintiffs gained no rights in fee to the land between the old and new lake margins; plaintiffs' easement, however, extended to the new location of the lake margin. SIPHON METHOD FOR MEASURING WATER LEVELS,
Geological Survey, Phoenix, Ariz. Water Resources Div.; and Agricultural Research Service, Chickasha, Okla. Soil and Water Conservation Research Div.
Coyd Yost, Jr. and James Nancy.
J Amer Water Works Ass, Vol 61, No 6, pp 314-316, June 1969. 3 p, 1 fig, 3 ref.

Descriptors: *Gaging stations, *Reservoirs, *Siphons, Pipelines, Tubes, Water measurement, Instrumentation, Reservoir stages, Water levels.
Identifiers: Reservoir gages.

The use of siphons for measuring reservoir water levels is discussed. If a gage in the reservoir or a tube to lead water through the dam to a remote gate is impractical, a siphon may be used to lead water over the dam, if the altitude difference between the water surface and siphon summit is not too great. Experience in designing and using the siphon method indicates that it is practical and generally applicable for measuring water levels in lakes, canals, streams, wells, and other open water bodies. Under certain field conditions the method is distinctly preferable to other methods. The characteristics that particularly contribute to the usefulness of the siphon method concern its accuracy and the fact that its installation, maintenance, and operation are simple and economical. For special applications the siphon may be designed as a light-weight portable unit and installed with hand tools. Absence of any horizontal inlet precludes difficulties in installation or structural damage to the canal, dam, or stream bank. The well and recorder may be remotely located at a convenient site relatively far from the water body. (USGS)

Descriptors: *Tensiometers, *Osmotic pressure, *Soil water, Soil moisture, Soil chemistry, Osmosis, Capillary action, Capillary water, Pore pressure, Moisture tension.

LIBRARY U. OF I., URBANA-CHAMPAIGN

Identifiers: *Osmotic tensiometer, Capillary potential.

An osmotic tensiometer makes use of a confined aqueous solution, instead of pure free water, as the reference state in measuring soil-water potentials. The membrane separating the confined solution from soil water is highly impermeable to the confined solute (polyethylene glycol, molecular weight 20,000), but exchange of much smaller molecules and ions occurs. Thus the capillary potential of soil-water is measured unless soil solutes are excluded from the instrument by a vapour gap. The advantage of this instrument over conventional tensiometers is that measurements of capillary potential can be made throughout the range 0 to minus 15 bar. Tests and observations show that osmotic tensiometers can be useful for measurements of capillary potential at depths greater than about 10 cm during the redistribution of soil water, and its uptake by plants. For accurate data, zero checks should be made when possible, and instrument temperature should be recorded to enable correction for its effect on each reading.

LEGAL RESEARCH IN WATER RESOURCES,
Office of Water Resources Research, Washington, D. C.
Roland R. Renne, and Glen D. Fulcher.
Land and Water L Rev, Vol 4, No 1, pp 145-158, 1969. 14 p, 12 ref.

Descriptors: *Water resources research act, *Water law, *Institutions, Legislation, Allotments, Universities, Water rights, Research facilities, Water resources development, Programs, Projects, Legal aspects, Future planning (Projected), Long term planning, Administration.

The Water Resources Research Act of 1964 established an Office of Water Resources Research and authorizes various institutions, firms, and agencies to carry out water research. The purpose of the research programs is to supplement and strengthen the total national water research effort. There are 4201 recorded projects underway, of which 3016 are federally supported and 735 are established under the 1964 Act. The research is grouped under 9 categories and 44 subcategories. Water law research is grouped under the Water Resources Planning category and is a study of water law looking toward changes to improve use efficiency and investigation of institutional structures influencing decisions on water. The content of legal research is divided generally among legal aspects, legislation, water rights, and water law. 3 tables show: (1) distribution of legal research by category; (2) the disciplines involved in water law research; (3) the organizations supporting legal research. Among the benefits from legal research are books and legislation. Promising research areas include: regional water development, weather modification, ground water pollution, thermal pollution, water rights and integration of surface and ground water use. The author concludes that future legal research should be oriented toward a more comprehensive approach, calling for interdisciplinary and interregional research. (Helwig-Fla)

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 2, NUMBER 18
SEPTEMBER 15, 1969

W69-07264 -- W69-07699

LIBRARY U. OF I., URBANA-CHAMPAIGN

Selected Water Resources Abstracts is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the Clearinghouse for Federal Scientific and Technical Information (CFSTI) of the Bureau of Standards, U. S. Department of Commerce. It is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U. S. Department of the Interior, Washington, D. C. 20240. Annual subscription is $22.00 (domestic), $27.50 (foreign), single copy price is $3.00. Certain documents abstracted in this journal can be purchased from the Clearinghouse at the prices indicated in the entry. Prepayment is required.

e of funds for printing this publication approved by the Director of the Bureau of the Budget, September 4, 1968.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources. WRSIC is not presently prepared to furnish loan or retention copies of the publications announced.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

LIBRARY U. OF I., URBANA-CHAMPAIGN

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas. Centers, and their subject coverage, now in operation are:

- Ground and surface water hydrology at the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources management at the Center for Urban Studies of the University of Chicago.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Research Institute of Rutgers University.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

LIBRARY U. OF I., URBANA-CHAMPAIGN

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

SOME NOTES ON THE RATIONAL METHOD OF STORM DRAIN DESIGN,
American Society of Civil Engineers, Cambridge, Mass. Engineering Sciences Lab.
M. B. McPherson.
ASCE Urban Water Resources Res Prog Tech Mem No 6, Jan 22, 1969. 84 p, 9 fig, 3 tab, 42 ref, 2 append. USGS Contract No. 14-08-0001-11257. Available from Clearinghouse as PB 184 701 at $3.00 in paper copy and $0.65 in microfiche.

Descriptors: *Urbanization, *Storm drains, *Rainfall-runoff relationships, *Rational formula, *Storm runoff, *Design, Drainage systems, Surface runoff, Routing, Hydrographs, Runoff, Hydraulic design, Design flood, Systems analysis, Stream gages, Gaging stations, Coefficient.
Identifiers: Storm drainage design.

Because the 'rational method' of designing urban storm-drainage facilities has substantial liabilities, new design procedures are discussed and the urgent need for more field stream-gaging data is stressed. The limitations of the rational method consist mainly of the weaknesses of projecting standard values of the rainfall-runoff relationship over wide geographical areas, the use of too many standardized assumptions, and using the same runoff routing methods in too many dissimilar situations. Suggested improved design methods would use on-site gaged rainfall-runoff relations to determine flow probabilities in mathematical models so that the optimum drainage system for each particular case may be designed. Presently there are no gaging programs of sufficient scope in operation. Other suggestions include the use of surface detention to flatten runoff peaks, storage of urban runoff for water-supply use, or use of urban runoff as a source of recreational water. (Knapp-USGS)

AVAILABILITY OF RAINFALL-RUNOFF DATA FOR SEWERED DRAINAGE CATCHMENTS,
American Society of Civil Engineers, Cambridge, Mass.
L. S. Tucker.
ASCE Urban Water Resources Res Program Tech Mem No 8, Mar 3, 1969. 43 p, 14 fig, 5 tab, 18 ref, 1 append. USGS Contract No 14-08-0001-11257, OWRR Contract No 14-01-0001-1585. Available from Clearinghouse as PB 184 703 at $3.00 in paper copy and $0.65 in microfiche.

Descriptors: *Data collections, *Gaging stations, *Cities, *Rainfall-runoff relationships, *Urbanization, Drainage systems, Runoff, Storm drains, Sewers, Storm runoff, Flow rates.
Identifiers: Urban runoff gaging, United States.

Data on the availability of rainfall-runoff data from gaged, sewered urban catchments are compiled. Only 13 completely sewered catchments in the U. S. are gaged. Runoff is measured by flume in Northwood, Gray Haven, and Swansea, all in Baltimore, Md. Reduced data from 29 Gray Haven Storms are tabulated. The 13 catchments are summarized in a table giving name, size, data collected, type of flowmeter, type of storm sewer, data available, operator of the installation, location, and period of operation. Each installation and catchment is described in detail. Baltimore has 3 gaged catchments, Cincinnatti, Ohio has 1, St. Louis, Mo. has 3, Chicago, Ill. has 1, Philadelphia, Pa. has 1, New York City has 4, and Washington D. C. has 1. (Knapp-USGS)

W69-07485

SEWERED DRAINAGE CATCHMENTS IN MAJOR CITIES,
American Society of Civil Engineers, Cambridge, Mass. Engineering Sciences Lab.
L. S. Tucker.
ASCE Urban Water Resources Res Program Tech Mem No 10, Mar 31, 1969. 71 p, 34 fig, 4 tab, 13 ref. USGS Contract No. 14-08-0001-11257. Available from Clearinghouse as PB 184 705 at $3.00 in paper copy and $0.65 in microfiche.

Descriptors: *Cities, *Rainfall-runoff relationships, *Storm drains, *Sewers, Storm runoff, Drainage systems, Water quality control, Water pollution control.
Identifiers: Urban rainfall-runoff-water quality relationships, Combined sewer systems.

The size distribution and number of sewered drainage catchments in San Francisco, Washington, D. C., Milwaukee, Houston, and Philadelphia are summarized to provide data for urban rainfall-runoff-water quality studies. The 4 cities are in 4 distinctly different regions of the US, and are different topographically. The sizes of all sewered drainage catchments are tabulated, maps show catchment boundaries, and supporting discussions are presented. Only the drainage catchments served entirely by storm or combined sewers are discussed, and partially sewered urban drainage catchments are omitted. The distribution of sewered drainage catchment size is unique for each city. The number of catchments varies from 42 in San Francisco to 1,283 in Houston. The largest catchment varies from 1,820 acres in Milwaukee to 6,180 acres in Washington, D. C. The average catchement size varies from 65 acres in Houston to 560 acres in San Francisco. The median catchment size varies from 6 acres in Houston to 190 acres in San Francisco. In Washington, D. C., drainage catchments varying in size from 1 to 50 acres account for 46% of the total number of catchments, but their cumulative area equals only 3% of the total District area served by sewers. On the other hand, over 50% of the total District area served by sewers is accounted for by the 5 largest drainage catchments, which are only 5% of the total of 93 catchments. (Knapp-USGS)

HYDROGRAPHIC CONDITIONS OFF THE NORTHEAST COAST OF ICELAND IN RELATION TO METEOROLOGICAL FACTORS,
Marine Research Institute, Reykjavik (Iceland).
Unnsteinn Stefansson, and Gudmundur Gudmundsson.
Tellus, Vol 21, No 2, pp 245-258, 1969. 14 p, 5 fig, 3 tab, 11 ref.

Descriptors: *Hydrography, *Meteorological data, *Hydrologic properties, Mathematical models, Water circulation, Air temperature, Velocity, Statistical methods, Density, Summer, Winter, Gaging stations, Salinity, Numerical analysis, Pressure, Forecasting, Mapping.
Identifiers: Hydrographic conditions.

The relationship between oceanographical and meteorological parameters of the northeastern coast of Iceland was analyzed analytically and experimentally on the basis of a mathematical model and recorded data given in earlier publications. The study confirms the existence of a strong connection between the oceanographical conditions, air temperature, and N-S winds about 90 days prior to the observations. The study also shows that the air temperature is a more important factor than the winds and its effect on the influx of Atlantic water can be considered to be of indirect character. (Gabriel-USGS)

A NONLINEAR MODEL OF THE FLOW OF AN INHOMOGENEOUS FLUID AT THE EQUATOR (RUSSIAN),
Akademiya Nauk SSSR. Institut Okeanologii.
L. M. Krivelevich.
Transl in Vol 4, No 2, pp 188-198. Izv Akad Nauk, Atmos i Okeanicheskaya Fizeka, Vol 4, No 2, pp 105-110, Feb 1968. 6 p, 5 fig, 14 ref.

LIBRARY U. OF I., URBANA-CHAMPAIGN

Descriptors: *Mathematical models, *Mathematical studies, *Equations, *Flow characteristics, Velocity, Density, Water circulation, Thermocline, Water temperature, Water pressure, Diffusion, Momentum transfer.
Identifiers: Nonlinear flow model.

To explain the phenomenon of subsurface equatorial currents a nonlinear model of a current flow was postulated. This analytical model was based on a two-layer model developed by Felsenbaum and Shapiro (1966) and Charney (1960) and assuming the density of each layer to be a known constant value and the density of sea water to be an unknown parameter. By using an electronic computer it was demonstrated that the interaction of oceanic velocity and density fields produces results which agree with the flow patterns recorded at the equator of the oceans. 2B. Precipitation

RAINFALL OVER GREAT BRITAIN AND NORTHERN IRELAND DURING 1968,
British Meteorological Office, London (England).
J. Grindley.
Water and Water Eng, Vol 73, No 878, pp 150-154, 161, Apr 1969. 6 p, 1 fig, 4 tab, 4 ref.

Descriptors: *Rainfall, *Meteorological data, *Climates, *Wet seasons, High water mark, Low water mark, Dry seasons, Storms, Precipitation (Atmospheric), Floods, Runoff, Temperature, Snowfall, Snowmelt, Anticyclones, Thunderstorms.
Identifiers: *Great Britain, *Northern Ireland.

Daily, monthly, and annual rainfalls over Great Britain and Northern Ireland were analyzed on the basis of precipitation data recorded at several gaging stations. The study shows that the total rainfall over England and Wales for 1968, although marginally smaller than that for 1967, was again substantially greater than average. The period 1965-68 has been the wettest period of 4 consecutive calendar years since 1927-1930. The year 1968 was dry in both Scotland and Northern Ireland although 1964 was considerably drier. HYDROLOGICAL FORECASTING IN THE USSR,
Hydrometeorological Service of the USSR (Moscow). Scientific Research Center.
V. V. Rakhmanov, and A. P. Shastin.
Nature and Resources, Vol 5, No 1, pp 9-13, Mar 1969. 5 p.

Descriptors: *Forecasting, *Streamflow forecasting, Flood forecasting, Synoptic analysis, Freezing, Rivers, Snowpacks, Infiltration, Runoff, Evaporation, Evapotranspiration.
Identifiers: USSR.

Hydrological forecasting agencies and techniques in the USSR are briefly reviewed. The most important research center was the Central Forecasting Institute, which in 1966 became the Hydrometeorological Research Center. The water balance method makes it possible to estimate river flow, water losses, and groundwater recharge. Snow sampling data are used in spring flood forecasting. Predictions of river ice formation and breakup are made by techniques of synoptic analysis. State institutes and university departments working in hydrology are listed and their work briefly described. Besides research, the Hydrometeorological Research Center furnishes forecasts, bulletins, warnings of dangerous hydrologic conditions, and notifies water users of particularly favorable conditions. The USSR hydrological network includes over 3000 stations. Annual aerial surveys are made of rivers, ice, and snow cover. (Knapp-USGS)
W69-07379

HYDROLOGIC AND CLIMATOLOGIC DATA, 1968, SALT LAKE COUNTY, UTAH,
Geological Survey, Salt Lake City, Utah.
A. G. Hely, R. W. Mower, and C. A. Horr.
Utah Basic-Data Release No 17, Open-file Rep, 1969. 70 p, 5 fig, 1 plate, 61 tab, 18 ref.

Descriptors: *Data collections, *Climatic data, *Hydrologic data, *Utah, Streamflow, Water quality, Water temperature, Water wells, Water levels, Precipitation (Atmospheric), Winds, Sediment discharge.
Identifiers: Salt Lake County (Utah).

Climatological groundwater and surface-water data for Salt Lake County, Utah, in 1968 are compiled. Tabulated data include precipitation, air temperature, evaporation, wind, well records, water levels, well discharges, water chemical analyses, stream water analyses, water temperatures, sediment discharges, and streamflow records. METEOROLOGICAL AND HYDROLOGICAL DROUGHT IN RARITAN RIVER BASIN IN NEW JERSEY,
Rutgers - The State Univ., New Brunswick, N. J. Water Resources Research Inst.
Chin S. Liu, and W. B. Snow.
OWRR Project A-002-N.J. June 1969. 6 p.

Descriptors: *Droughts, Water balance, *Hydrologic data, Sequential generation, New Jersey, Meteorological data.
Identifiers: *Raritan River Basin, Hydrological data.

The 1961-66 drought in the Northern part of New Jersey was the most intense ever recorded in the region. The meteorological droughts, indicated by the Palmer Drought Index, and the corresponding hydrological droughts were investigated. The drought sequence is a time series characterized by a Markov chain process. Long sequences of generated drought data were utilized for evaluating the various drought distributions.

PHYSICAL STATE PROPERTIES OF PRECIPITATION,
Idaho Univ., Moscow. Dept. of Electrical Engineering.
G. A. McKean, and J. C. Read.
Research Technical Completion Report, March, 1969. 20 p, 4 tab, 5 fig, 9 ref. OWRR Project A-008-IDA.

Descriptors: *Precipitation, *Rain, *Snow, *Precipitation gages, Precipitation (Atmospheric), Rainfall (Impact), Rainfall distribution.

The object of this research was to study the properties of snow or rain in the falling state that would permit positive identification of the state of the precipitation. The ultimate application was to provide a record of when it was raining or snowing and to provide a means of relating the record to conventional recording precipitation gage records. Various properties of precipitation were evaluated both by literature search and by laboratory investigation. Properties investigated included conductivity, storage of static charge, impact momentum, acoustic energies, and both optical reflectivity and opacity. Optical reflectance proved to have the most promise and a scheme for making such a measurement was proposed. Subsequent to this a prototype device was developed.

Norbert V. DeByle, Robert S. Johnston, Ronald K. Tew, and Robert D. Doty.
International Conference on Arid Lands in a Changing World, Arizona University, Tucson, June 3-13, 1969. 14 p, 3 fig, 3 tab.

Descriptors: *Watershed management, *Evapotranspiration, *Soil-water-plant relationships, *Vegetation effects, Watersheds (Basins), Arid lands, Water yield improvement, Hydrologic cycle, Soil moisture, Water balance, Habitat improvement, Ground cover effects, Utah.

Evapotranspiration is the principle component of the hydrologic cycle that can be modified by watershed managers. In the western U.S. measured soil moisture depletion plus summer precipitation gives a good estimate of actual evapotranspiration. 14 sites representing 10 vegetative types typical of Utah's water yielding lands were studied. Soil moisture depletion during the growing season, measured with the neutron scatter technique, varied from 0.88 in. under a young stand of aspen sprouts to 20.38 in. under a mature aspen stand. Losses from grass, Gamble oak, sagebrush, snow berry, Douglas fir and bare soil were intermediate. The resulting inventory of water use by native plant communities, elevation 6,100 ft. to 9,200 ft., provides a basis for further water yield improvement research, especially for measuring effects of converting or modifying vegetation on watersheds in arid regions. (Sherbrooke-Ariz)

THE INFLUENCE OF EVAPORATION ON THE QUALITY OF WATER STORED IN SAND,
National Inst. for Water Research, Windhoek (South Africa).
D. H. R. Hellwig.
International Conference on Arid Lands in a Changing World, Arizona University, Tucson, June 3-13, 1969. 30 p, 8 tab, 7 fig, 6 ref.

Descriptors: *Evaporation, *Underground storage, *Arid lands, Soil water movement, Water loss, Natural recharge, Subsurface waters, Aeolian soils, Water table, Hydrologic properties, Leaching, Salt balance, Soil water, Dissolved solids.
Identifiers: South West Africa.

A determination was made of the effect of evaporation on the salt concentration of water at various depths, when stored in sand. Three different sand mixtures in 10 evaporation tanks with three different water tables were used. Rate of evaporation and loss of salts from solution increased with firmness of sand and decreasing depths of water table from the surface. Salt loss from solution (%) increased with evaporation according to a hyperbolic relationship; salt accumulated at or above the water table. Water quality near the bottom was unchanged by high evaporation. Heavy rain washed salts from sand above the water table downward, increasing the T.D.S. concentration. This effect increased with coarseness of sand and depth of water table. These results assist in a better understanding of the influence of evaporation on the salt concentration of water stored in sand beds of rivers in arid regions. (Sherbrooke-Ariz)

HEAT FLUX AND TEMPERATURE VARIATION AT A WAVY WATER-AIR INTERFACE,
State Univ. of New York, Stony Brook. Coll. of Engineering.
Edward E. O'Brien, and Thore Omholt.
J Geophys Res, Vol 74, No 13, pp 3384-3385, June 20, 1969. 2 p, 6 ref. NSF Grant No GK1715.

Descriptors: *Air-water interfaces, *Waves (Water), *Heat flow, *Heat transfer, Convection, Conduction, Evaporation, Boundary processes, Heat balance, Temperature, Thermal stratification, Solar radiation.
Identifiers: Heat flux.

Surface temperature and heat flux variations induced by a progressive wave on a thin layer of water across which steep thermal gradients exist may be predicted. It is shown that molecular conduction and convection due to the wave alone, excluding any buoyancy induced convection, do not account for the behavior of the surface temperature that has been observed in a wave tank. Descriptors: *Evaporation, *Air-earth interfaces, *Soil water, Boundary processes, Mathematical models, Water loss, Heat budget, Mass transfer, Solar radiation, Microenvironment, Soil water movement, Winds, Convection, Turbulence, Diffusion, Dispersion.
Identifiers: Wet ground evaporation.

A solution is obtained for the turbulent diffusion equation, considering only the upward and forward diffusion but neglecting the lateral diffusion and the forward convection by the mean wind. With the proper boundary conditions this equation describes evaporation from an extremely narrow wet surface at ground level, which extends laterally to infinity. Comparison of this solution with an earlier solution for evaporation from an extremely small circular surface shows that the effect of lateral diffusion on the evaporation from such a surface increases with increasing stability of the atmosphere. This effect is under neutral conditions probably of the order of 13%. (Knapp-USGS)

STUDY OF ENERGY BALANCE AT BRAZZAVILLE (FRENCH),
Office de la Recherche Scientifique et Technique Outre-Mer, Paris (France). Dept. of Hydrological Research.
Ch. Riou, and R. Chartier.
Cah ORSTOM, Ser Hydrol, Vol 5, No 4, pp 25-42, 1968. 18 p, 4 fig, 4 photo, 1 tab, 3 ref.

Descriptors: *Energy budget, *Energy equation, *Evapotranspiration, Lysimeters, Temperature, Latent heat, Sun, Radiation, Albedo, Air circulation, Heat balance, Atmospheric physics, Humidity, Soil temperature, Seasonal, Heat flow, Vegetation, Forests, Vapor pressure, Tension, Turbulence.
Identifiers: Brazzaville energy-balance study.

This investigation was the study of the application of the energy-balance method to the data given by Bowan in his report on a turbulent flow observed at Brazzaville and R. Charteer's albedo measurements conducted in the Brazzavile area. The computed parameters of the energy balance method were the total radiation, reflected radiation, temperature and humidity gradients above the ground, temperature gradient of the ground, evapotranspiration, and other pertinent coefficients. The study shows that it is perhaps premature to draw some definite conclusions from the results of this study, although the goal of this study was the presentation of a technique suitable for a humid climate. However, it is strongly believed that an improved energy-balance method offers the best possibility for the determination of the reaction of vegetable cover to the solar energy radiation. 2E. Streamflow and Runoff

STREAM BOUNDARIES OF SUBCRITICAL FLOW IN A TRAPEZOIDAL CHANNEL EXPANSION,
London Univ. (England); and West Ham College of Tech., London (England).
S. K. A. Naib.
Water and Water Eng, Vol 73, No 878, pp 155-158, Apr 1969. 4 p, 8 fig, 11 ref.

Descriptors: *Subcritical flow, *Streamflow, *Streamflow forecasting, *Model studies, Mathematical studies, Flow measurement, Jets, Velocity, River beds, Slopes, Energy dissipation, Pressure, Water Circulation.
Identifiers: Critical flow model study.

Stream boundaries of subcritical flows were investigated by both analytically and experimentally by using rectangular and trapezoidal channel models and a theoretical solution for the flow behind a two-dimensional bluff body developed by G. K. Abramovich. Measurements of the velocity profiles and flow boundaries in the mixing region of a rectangular stream expanding abruptly into a trapezoidal channel with side slopes of 1 vertical to 2 horizontal were made and presented here as the generalized curves of velocity profiles, spreading of stream boundaries, variation of left and drag coefficients, and other parameters. A rational method for designing the protection downstream of sudden transitions is suggested. (Gabriel-USGS)

METEOROLOGICAL CAUSES FOR THE AUGUST FLOODS BETWEEN 1950 AND 1960 (FRENCH),
Rene Viala.
Rev Geogr Des Pyrenees Et Sud-Ouest, Vol 40, No 2, pp 171-178, Apr 1969. 8 p, 5 fig, 3 tab.

Descriptors: *Floods, *Meteorological data, Water balance, Rain, Precipitation (Atmospheric), Climates, Discharge (Water), Gaging stations, High water mark, Low water mark, Winter, Summer, Spring, Storm runoff, River basins, Winds.
Identifiers: Meteorological causes of floods.

Meteorological effects on August floods were investigated on the basis of hydrological and meteorological data recorded in France during the 1950-1960 period. The study shows that the topography of a region, the line separating the Atlantic waters from those of the Mediterranean Sea, and rain intensity play a significant role in developing floods in France. es, mostly vertical and parallel or subparallel to
fissure zone, control movement and discharge
roundwater because they are less permeable
the rocks they intrude. Dikes impound or
ly impound ground water by preventing or re-
ing its movement toward discharge points.
neability is high in less weathered mountain
s and is highest farthest away from the dike
plex. Ground-water storage fluctuates to some
ee owing to limited changes in the level of the
nwater reservoir-maximum storage is about
00 million gallons. Perennial streams intersect
-level water and collectively form its principal
harge. The larger streams are those that cut
est into high-level reservoirs. Except near the
t in the northern end of the area, where dikes
absent, total base flow of streams equals total
ndwater discharge. The dependable flow of
r is estimated at 118 mgd, of which 84 mgd is
harged by streams, tunnels, springs, and wells.
remaining 34 mgd is underflow, most of it
harging into the sea near the northern end of
rea. Average flow is estimated at 220 mgd, of
h 150 mgd is inventoried flow and 61 mgd is
nated underflow. Specific capacity of wells
ing lava flows of the Koolau Volcanic Series
es from less than 1 to 11 gpd/ft of drawdown in
dike-complex zone and from 2 to 100 in the
ginal dike zone. A transmissivity of 4,000,000
ft was determined for the basal aquifer. The
nical quality of water in wells and tunnels tapping rocks of the Koolau and Honolulu Volcanic Series is excellent. (Knapp-USGS)

DIGITAL SIMULATION OF CHANNEL NETWORKS,
IBM Watson Research Center, Yorktown Heights, N. Y.
J. S. Smart, A. J. Surkan, and J. P. Considine.
Comm of Surface Waters, Proc Gen Assembly of Bern (Sept-Oct 1967), Int Ass Sci Hydrol, Pub No 75, pp 87-98, 1967. 12 p, 3 fig, 4 tab, 13 ref.

Descriptors: *Synthetic hydrology, *Stochastic processes, *River systems, *River basins, *Computer programs, Computer models, Digital computers, Statistical methods, Monte Carlo method, Probability.
Identifiers: Random walk method.

The random-walk method proposed by Leopold and Langbein for simulating channel networks has been programmed for a digital computer. Rules for generating the patterns are described in detail and a flow chart of the program is given. Analysis of about 600 networks produced by the program shows that the means and ranges of dimensionless geomorphological parameters are very similar to those observed in real stream systems. The stream number distributions for the simulated networks are in fair agreement with Shreve's theory but there are systematic deviations. Analysis of length distribution data suggests that first order streams in actual networks have an exponential length distribution. (Knapp-USGS)

DISCHARGE AS RELATED TO STREAM SYSTEM MORPHOLOGY,
Illinois State Water Survey, Urbana.
John B. Stall, and Yu-Si Fok.
Comm of Surface Waters, Proc Gen Assembly of Bern (Sept-Oct 1967), Int Ass Sci Hydrol, Pub No 75, pp 224-235, 1967. 12 p, 7 fig, 1 tab, 11 ref.

Descriptors: *Channel morphology, *Discharge (Water), *Illinois, Meanders, Geomorphology, Slopes, Alluvial channels, Banks, Beds, Depth, Shape, Slopes, Width, Channel erosion, Channel flow, Hydraulics, Regimes, Streamflow.
Identifiers: *Drainage basin morphology, Hortons law, Stream orders, Embarras River (Ill).

The basin of the Embarras River in Illinois is 2,400 sq mi in size and about 90% of the land is cultivated. The streams have relatively shallow gradients and the basin is typical of much of the mid-western USA. The Embarras has a drop of 317 ft throughout its course of 202 mi, for an average slope of 1.6 ft per mi. The morphological structure of the stream system has been analyzed using the Horton-Strahler stream ordering system. The stream network conforms to an excellent degree to the following laws of Horton: the law of stream numbers, the law of stream lengths, and the law of stream slopes. The sinuosity of streams in the basin is shown to increase geometrically with the stream order. Discharges at 8 stream gaging stations within the basin are shown to be related to stream order and to the frequency of occurrence of the discharge. Discharge measurements of the 8 stream gaging stations provide rating curves through which other hydraulic factors of the stream can be related to stream order. (Knapp-USGS)
W69-07547

THE INFLUENCE OF VEGETATION ON CHANNEL FORM OF SMALL STREAMS,
Agricultural Research Service, Beltsville, Md. Soil and Water Conservation Research Div.; and Johns Hopkins Univ., Baltimore, Md. Dept. of Geography.
R. C. Zimmerman, J. C. Goodlett, and G. H. Comer.
Comm of Surface Waters, Proc Gen Assembly of Bern (Sept-Oct 1967), Int Ass Sci Hydrol, Pub No 75, pp 255-275, 1967. 21 p, 8 fig, 3 tab, 9 ref.

Descriptors: *Channel morphology, *Vegetation effects, Streamflow, Stage-discharge relations, Roughness (Hydraulic), Retardance, Slopes, Width, Depth, Channel flow, Bank erosion, Erosion, Sediment yield.
Identifiers: Channel forms, Bank shear strength.

Data on channel width of several small streams in the Sleepers River basin of northern Vermont show the influence of vegetation on channel form. Channel width in small streams is clearly related to type of vegetation, as channels are alternately wide under forest and narrow in sod. Along one stream, width increases in response to increases in discharge where the drainage area exceeds 0.3 sq mi, but the variability in width also increases, reaching a maximum where the drainage area is about 2 sq mi. Relatively uniform channel widths occur where the drainage area is about 6 sq mi. Similar relationships were found in other streams sampled. In the Sleepers River basin there are apparently 2 thresholds along streams. In a downstream direction, the first threshold occurs where drainage areas are 0.2 to 0.8 sq mi. Upstream from the threshold width does not increase with discharge, living tree roots cross the channel, and dams of organic debris are common. The flow is commonly underground. Where drainage areas are 0.2-0.8 sq mi, annual high flows are 10 to 20 cfs. With drainage areas exceeding 0.2-0.8 sq mi, widths increase, but channel form is highly variable, and mean channel widths may vary by as much as 5 feet depending upon the type of vegetation. Relatively uniform channel widths occur, regardless of vegetation, where the drainage areas exceed 4 to 6 sq mi. Drainage areas about 5 square miles are apparently the second threshold. These have annual high flows in the range of 100 to 150 cfs. With higher discharge, the influence of vegetation on channel form is marginal compared with that of geologic differences and the sinuousity of the flow itself. Vegetation influences channel form by varying the roughness and shear strength of bed and banks. (Knapp-USGS)

Identifiers: Ungaged rivers, Streamflow estimation.

An analysis of data on hydraulic parameters collected during single boat trips down river systems is

LIBRARY U. OF I., URBANA-CHAMPAIGN

presented, plotted in form of the hydraulic geometry. The data were taken on 2 separate boat trips down rivers. In one, no previous measurements were available but there is 1 gaging station downstream; the river studied is the John River, Alaska. The other river is the Middle Fork of the Salmon River, Idaho, Snake River system, from Dagger falls to the Salmon River, assistance of about 100 mi. In this basin there are several gaging stations, but the records from these were studied only after the field expedition was over. A dimensionless rating curve is used to estimate bankfull and average discharge for basins of various sizes. When compared with gaging station data, estimates of bankfull discharge are as consistent and possibly are equal in accuracy to estimates made from gaging station data. Estimates of average discharge are less consistent; within the range of drainage areas represented by the gaging stations, errors of estimate vary from 0 to 58%. Local variations of bed material size along the river are compensated mostly by changes in local channel slope and roughness and do not much affect the progressive downstream changes in width, depth, or velocity. (Knapp-USGS)

2F. Groundwater

THEORETICAL ANALYSIS OF REGIONAL GROUNDWATER FLOW, 3. QUANTITATIVE INTERPRETATIONS,
R. Allan Freeze, and P. A. Witherspoon.
Water Resources Research, V 4, No 3, pp 581-590, June, 1968. 10 p, 3 fig, 13 ref.

Descriptors: *Mathematical models, *Basins, *Groundwater movement, Arid lands, Subsurface drainage, Water balance, Watersheds (Basins), Darcy's law, Flow nets, Safe yield, Groundwater recharge, Discharge (Water), Digital computers, Water resources development.

The natural basin ground water yield can be calculated from a quantitative analysis of the flow net obtained from a digital computer solution to a numerical mathematical model of the basin. The natural basin yield can be considered as a measure of the groundwater recharge to the basin and a conservative estimate of the safe yield. Rates of groundwater recharge and discharge vary geographically within a basin; positions of concentration can be determined by quantitative analysis. Quantitative interpretation of groundwater flow nets can play an important role in the calculation of basin-wide water balances. These methods can be useful in planning the development of many arid or semi-arid near-virgin basins in the American west and the Canadian prairies. (Sherbrooke-Ariz)

GRAVIMETRIC ESTIMATION OF DEPTH TO AQUIFERS IN THE HAZEVA AREA, ARAVA VALLEY, ISRAEL,
P. R. May.
Israel Journal of Earth-Sciences, v 17, no 1, pp 30-43, 1968. 14 p, 7 fig, 5 ref.

Descriptors: *Hydrologic aspects, *Gravity studies, Aquifer characteristics, Arid lands, Limestones, Geologic formations, Groundwater basins, Depth.
Identifiers: Arava Valley, Israel.

Aquifers in the Judea limestone extend from outcrops on the Negev uplands to the arid Hazeva area in the Arava Valley and eastward to the western border fault of the Dead Sea graben. A gravity survey shows the Hazeva area to be part of a shallow intermontane basin in which the Judea limestone lies at depths of 100 m. in the S.W. to 450 m. on the east. Depth estimations are made at six localities along the bounding faults by direct computation of the total anomaly caused and the maximum residual gradient. The principle density interface in the geologic column occurs at the top of the Judea limestone. The area east of the Sedom-Elat highway, but west of the badlands of Nahal Idan, is topographically the best suited to settlement and agriculture. A groundwater exploration drilling program should include penetration of the Cenomanian position, with wells drilled to at least 200 m. below the top of the limestone. (Sherbrooke-Ariz)

COMPOSITIONAL SIMILARITIES BETWEEN HOT MINERAL SPRINGS IN THE JORDAN AND SUEZ RIFT VALLEYS,
Israel Atomic Energy Commission, Rehovoth; and Weizmann Inst. of Science, Rehovoth (Israel).
Emanuel Mazor.
Nature, v 219, August 3, pp 477-478, 1968. 2 p, 2 fig, 7 ref.

Descriptors: *Hot springs, *Mineral water, *Aquifer characteristics, Water chemistry, Geologic control, Water temperature, Encroachment, Mixing, Saline water intrusion.
Identifiers: Jordan Rift Valley, Suez Rift Valleys.

The chemical composition of the Hammam Farun hot spring (72 deg C) in the Suez Rift Valley is found to be almost identical to that of the Tiberias Hot Springs (60 deg C) in the Jordan Rift Valley. The chemical nature of the Tiberias Hot Springs is hypothesized to result from a past oceanic invasion of the valley, whose waters reacted with the host rocks. The composition of Hammam Farun spring, 30 m. from the sea, is attributed to deep seawater mixing with local groundwater, having reacted with the host rock. Expected ionic changes are verified. Springs of the arid Jordan Rift Valley are thought to result from the continuous tectonic activity of the area forcing deep hot mineral waters to the surface. (Sherbrooke-Ariz)

OUTLINES OF GROUNDWATER RESOURCES OF SAUDI ARABIA,
Ministry of Agriculture and Water, Riyadh (Saudi Arabia).
Galip Otkun.
International Conference on Arid Lands in a Changing World, Arizona University, Tucson, June 3-13, 1969. 16 p, 2 fig, 1 tab, 14 ref.

Descriptors: *Aquifer characteristics, Aquifers, Artesian wells, Deep wells, Depth, Discharge coefficient, Geologic formations, Groundwater recharge, Groundwater, Subsurface water, Karst, Hydrogeology, Natural recharge, Specific yield, Arid lands, Deserts.
Identifiers: Saudi Arabia.

A report on the characteristics and development of the groundwater resources of the desert Kingdom of Saudi Arabia, which lacks perennial rivers and has only scarce sporadic showers. In recent years hydrogeological investigations and drilling of more than a thousand production and exploratory wells revealed the existence of 16 aquifers, at least 10 of which are reliable and prolific. Nine of these are treated in detail, including information on geology, depth, transmissibility, number of wells, total dissolved solids, age, recharge, infiltration rate, geographic extent, and importance to the economy. Saudi Arabia which is very poor in surface water possesses rich groundwater resources. Included are a block diagram of geologic structures, a geologic map, and a table of aquifer characteristics. (Sherbrooke-Ariz)

HYDROGEOLOGICAL APPRECIATIONS OF THE PROVINCE OF LA RIOJA,
Mario V. J. Sosic.
International Conference on Water for Peace, Washington, D. C., 1967, Water for Peace, v 4 (Basic Data for Water Programs), p. 928-932, 1968. 4 p. For 8 volume proceedings see vol 2 no 9, field 06B, W69-03305.

Descriptors: *Hydrological aspects, *Arid la
Streamflow, Aquifer characteristics, De
Groundwater basins, Hydrogeology, Hydrol
properties, Saline soils.
Identifiers: La Rioja Prov. (Argentina).

Situated in the arid Argentine Northwest, La F
Province possesses a considerable reserve of
derground water, which is hardly exploited and
completely investigated. Economic progress
requires the rational use of surface waters. The
lowing hydrogeologic zones are discussed: (1)
La Rioja Plains, (2) southern areas of Sala
Pipanaco, (3) the valley of river San Blas de
Sauces, (4) the alluvial cones of the rivers S
Cruz, Campanas, Pituil, (5) Valley of
Colorados Antinanco, (6) Valley of River Bern
(7) the Pocket of Jague, and (8) Valley of G
dacol. Topics considered include quality of w
depth of water, demand for water, river syst
well yields, soil salinity, and regional economy.
4 most propitious areas for rational undergro
water exploitation are indicated. (Sherbro
Ariz)

ROPERTIES OF THE ROCKY MOUNTAIN RSENAL DISPOSAL RESERVOIR AND THEIR ELATION TO DERBY EARTHQUAKES,
olorado School of Mines, Golden. Dept. of ophysics.
R. Pickett.
olo School Mines Quart, Vol 63, No 1, pp 73-100, n 1968. 28 p, 12 fig, 6 tab, 10 ref, 1 append.

escriptors: *Earthquakes, *Injection wells, Vaste disposal, *Colorado, Hydrostatic pressure, actures (Geology), Faults (Geology), Ground-ter basins, Aquifers, Porosity, Permeability, ructural geology, Pore pressure.
entifiers: *Rocky Mountain Arsenal, Denver olo).

ection pressure and volume data of the Rocky ountain Arsenal disposal well were studied to rn the physical properties of the reservoir and to rrelate reservoir properties with the earthquake story of the area. The Rocky Mountain disposal servoir contains a total fluid volume between 0.6 d 1.9 X 10 billion barrels. The total reservoir nsists of several parts which have significantly ferent fluid permeabilities. The reservoir pres-re before start of injection in 1962 was between 0 and 1400 psi subhydrostatic. After cessation of ection in 1966, the different parts of the reser-ir were at different pressures, the most permea-part having the highest pressure (about 100 psi ohydrostatic). An empirical correlation exists for injection history of the Arsenal well between mulative number of earthquakes and calculated tic reservoir pressure. A means for predicting total number of earthquakes to be anticipated fore the reservoir comes to pressure equilibrium suggested. Empirical comparison of injection ergy with earthquake magnitude shows that if in-tion energy is returned as earthquake energy, it stored for significant lengths of time before ease. If it is assumed that all injection energy has w been returned as earthquake energy, then the al energy magnitude is consistent with energy-rthquake magnitude relations proposed by chter. /DRAULIC CHARACTER OF FRACTURED ETAMORPHIC ROCKS OF THE FRONT NGE AND IMPLICATIONS TO THE ROCKY OUNTAIN ARSENAL WELL,
lorado School of Mines, Golden. Dept. of ology.
vid T. Snow.
lo School Mines Quart, Vol 63, No 1, pp 167-9, Jan 1968. 33 p, 13 fig, 27 ref.

scriptors: *Earthquakes, *Injection wells, /aste disposal, *Colorado, Hydrostatic pressure, Fractures (Geology), Faults (Geology), Groundwater basins, Aquifers, Porosity, Permeability, Transmissivity, Aquicludes, Structural geology, Pore pressure.
Identifiers: Rocky Mountain Arsenal, Denver (Colo).

Hydraulic and geometrical properties of fractured metamorphic rocks of the Front Range of Colorado are determined from damsite pressure-injection tests and records of domestic water wells. Since these same rocks beneath the Denver basin comprise the reservoir into which fluid wastes have been injected at the Rocky Mountain Arsenal Well, the Front Range properties are applicable to studies of the Arsenal well injection performance and the possible earthquake response. Fracture permeability may be of like origin in both cases: faulting, weathering and erosional stress release beneath a surface of erosion. At damsites in the Front Range metamorphic rocks, fracture spacing is about 5 to 10 ft near the ground surface, increasing to about 15 to 35 ft at the 200-ft level. Water wells intercept even fewe. significant fractures. Openings close from about 200 microns to about 70 microns between the near-surface and 200-ft depth and porosites decrease from about 0.04% to 0.001%. The logarithm of permeability decreases linearly with the logarithm of depth. The fractured aquifer is a thin skin draped over the terrane. Test data suggest that the aquifer is bounded by vanishing permeability at about 200 ft, though open fault zones may extend to greater depths. Different lithologic units have different transmissibilities. These exceed the transmissibilities deducted from Arsenal well flow, so the pre-Pennsylvanian soils and sediments resting on the gneiss at the well site may effectively confine flow to the fractured basement. (Knapp-USGS)

FRACTURE DEFORMATION AND CHANGES OF PERMEABILITY AND STORAGE UPON CHANGES OF FLUID PRESSURE,
Colorado School of Mines, Golden. Dept. of Geology.
David T. Snow.
Colo School Mines Quart, Vol 63, No 1, pp 201-244, Jan 1968. 44 p, 10 fig, 43 ref.

Descriptors: *Earthquakes, *Injection wells, *Waste disposal, *Colorado, Hydrostatic pressure, Fractures (Geology), Faults (Geology), Stress, Groundwater basins, Aquifers, Porosity, Permeability, Water storage, Transmissivity, Aquicludes, Structural geology, Pore pressure.
Identifiers: Rocky Mountain Arsenal, Denver (Colo).

Fractures are non-rigid fluid conductors of such small size that changes of the openings with changes of pressure result in appreciable changes of permeability and account for the major portion of storage. Plane vertical strain is assumed in the derivation of an equation of transient flow, but in radial cases, such as the Rocky Mountain Arsenal Well injection, the distributions of stress, permeability, and hydraulic potential are interrelated. A deformability coefficient for fractures in the Front Range metamorphic rocks at Bergen Park, Colorado, is deduced from strain measurements near a water-supply well which drains the fracture system. Effective stress changes consequent to fluid-pressure changes may have significance to the question of the earthquake mechanism, especially if geological evidence, such as faulting, points to a critical state of tectonic stress. From the time of latest faulting in the Denver basin probably criticality may have been maintained by erosional release of confinement, suggesting that the fractured basement is prone to failure upon injection of fluids. HYDRODYNAMIC STUDY OF THE WESTERN DENVER BASIN, COLORADO,
Petroleum Research Corp., Denver, Colo.
Roger L. Hoeger.
Colo School Mines Quart, Vol 63, No 1, pp 245-251, Jan 1968. 7 p.

Descriptors: *Earthquakes, *Injection wells, *Waste disposal, *Colorado, Hydrostatic pressure, Potentiometric level, Fractures (Geology), Faults (Geology), Groundwater movement, Stress, Groundwater basins, Aquifers, Porosity, Transmissivity, Aquicludes, Structural geology, Pore pressure.
Identifiers: Rocky Mountain Arsenal, Denver (Colo).

The original hydrostatic pressure in the fracture system of Precambrian basement rocks in the Rocky Mountain Arsenal well was far below normal. In an effort to understand the reasons for the subnormal pressure, a study of hydrodynamic pressure gradients in overlying sedimentary rocks of the western Denver basin was considered necessary. An analysis of all available data on the major deep aquifers is presented. A barrier trend, which may be caused by a fault system of regional extent, is present between the areas of high potential and the majority of the area studied which is typically at much lower potential. HYDROLOGY OF SOME SMALL GROUNDWATER BASINS IN IDAHO,
Idaho Univ., Moscow. Dept. of Geology.
Robert W. Jones.
Idaho Water Resources Research Institute, Termination Report, February, 1968. 7 p, 4 ref. OWRR Project A-020-IDA.

Descriptors: *Ground water, Hydrologic models, Hydrologic data, *Experimental ground water basins.

One basin has been studied (Albion basin, Cassia County, Idaho) and the results published as an open file report by the Idaho Bureau of Mines and Geology. Aquifers were delineated, water-table mapped, and preliminary evaluation of the groundwater flow pattern was obtained. Wells range in depth from 11 feet to 700 feet and yields range up 540 gpm. Clay lenses in alluvium create local artesian aquifers. The water can be classified as calcium bicarbonate type and is suitable for domestic and irrigation use. The total dissolved solids content range from 202 ppm to 2294 ppm. Hot springs exist in the Marsh Canyon area. The study should serve as a basis for further investigations utilizing experimental approaches.

DETAILED GROUND WATER INVESTIGATION OF MOSCOW BASIN,
Idaho Univ., Moscow. Dept. of Geology.
Robert W. Jones, and Sylvia H. Ross.
Idaho Water Resources Research Institute Research Technical Completion Report, June, 1969, Moscow, Idaho, 12 p, 3 fig, 11 ref. OWRR Project A-011-IDA.

Descriptors: *Ground water, *Basalt, *Sedimentary interbeds, *Columbia River Group, *Type area, *Small ground water basins, Field pumping tests, *Mathematical models, Artesian aquifers, *Recharge, *Storage, Coefficient of transmissibility, Coefficient of storage, *Artificial recharge, Intermittent streams, *Iron in water.

Moscow basin, a 58 square-mile, U-shaped basin with a 12 square-mile central lowland underlain by basalt flows and sedimentary interbeds of the Columbia River Group, is a type area for the study of the small ground water basins underlain by basalt that are common in the Pacific Northwest. Because field pumping tests were not practical, mathematical models of the artesian aquifers were designed. Comparison of the performance of the model aquifers with that of the real aquifers indicates that, if no recharge is taking place, ground water in storage will meet the needs of the basin until 2050 or 2100. However, values of coefficient of transmissibility ('T') and coefficient of storage

LIBRARY U. OF I., URBANA-CHAMPAIGN

('S') are very high in the no-recharge models. If the real values are significantly lower, then considerable recharge is taking place. No studies have been made of models that receive recharge. Model studies were used to demonstrate the feasibility of artificial recharge utilizing seasonal runoff of intermittent streams. High contents of iron in waters in parts of the artesian aquifers are the result of naturally recharging waters carrying in iron from weathered bedrock on the margins of the basin.

PALEOHYDROGEOLOGICAL ANALYSIS PRINCIPLES OF ARTESIAN BASINS (RUSSIAN),
Ministry of Geology.
A. N. Sultankhodzhayev, V. G. Tyminskiy, N. A. Surganova, and I. M. Rosanova.
(Geol J of Uzbek), No 1, pp 49-53, 1969. 5 p, 1 tab, 8 ref.

Descriptors: *Paleohydrology, *Analysis, *Artesian wells, *River basins, Chemical analysis, Water chemistry, Groundwater, Porosity, Hydrogen, Oxygen, Radioactivity, Mineral water, Mathematical studies, Helium, Radioisotopes, Deuterium, Chlorine, Sulfides, Aquifers, Fissures (Geology).
Identifiers: Paleohydrogeological analysis, Artesian basins.

On the basis of a formula developed by V. G. Tyminskiy and his associates (1966) and using the He/Ar method, the chemical analyses of the fresh and mineralized parts of the artesian basin waters and the relative age of these parts was made by using the aquifers of Tashkent, Fergana and Kyzyl Kum areas. The study shows that by assuming the existence of three genetic groups characterized by their chemical composition, their paleogeographic, geographic and other parameters, the paleohydrological material should be of value. It should give not only the ratio of groundwater in a mixture, but the ratio of infiltrated water in the mixture, as well. The use of the He/Ar method guarantees a reliable determination of the age of waters taking part in the mixture. (Gabriel-USGS)

GEOHYDROLOGY AND WATER UTILIZATION IN THE WILLCOX BASIN, GRAHAM AND COCHISE COUNTIES, ARIZONA,
Geological Survey, Washington, D. C.
S. G. Brown, and H. H. Schumann.
Geol Surv Water-Supply Pap 1859-F, pp F1-f32, 1969. 32 p, 7 fig, 3 plate, 2 tab, 17 ref.

Descriptors: *Water resources, *Water utilization, *Groundwater, *Arizona, Groundwater movement, Recharge, Discharge (Water), Evapotranspiration, Streamflow, Water yield, Transmissivity, Specific capacity, Hydrogeology, Groundwater basins.
Identifiers: Willcox basin (Ariz).

The Willcox basin is an area of interior drainage in Cochise and Graham Counties, Arizona. The basin comprises about 1,500 sq mi, of which the valley floor occupies about 950 sq mi. Even in areas where the consolidated rocks are fractured and jointed, only small amounts of water have been developed. The rocks of the basin consist of alluvium, in which lenticular sand and gravel layers interbedded in silt-and clay-size material constitute the principal aquifer. The median specific capacity of wells ranges from 7.4 to 20 gpm/100 ft of saturated material penetrated. The coefficient of transmissibility of the aquifers ranged from 58,000 to 160,000 gpd/ft. The estimate of the evapotranspiration in the playa area before large-scale development was about 75,000 acre-ft/yr. Underflow toward the playa was computed to be about 54,000 acre-ft/yr. Ground water has been used for irrigation since 1910. In 1928, about 4,000 acre-ft of groundwater was pumped, and by 1963 180,000 acre-ft/yr was being pumped. Water-level declines for 1962-63 exceeded 10 ft/yr in some wells in the more heavily pumped Kansas Settlement area and 7 ft/yr in the Stewart area. (Knapp-USGS)

REGIONAL HYDROGEOLOGY OF THE NAVAJO AND HOPI INDIAN RESERVATIONS, ARIZONA, NEW MEXICO, AND UTAH,
Geological Survey, Washington, D. C.
M. E. Cooley, J. W. Harshbarger, J. P. Akers, W. F. Hardt, and O. N. Hicks.
Geol Surv Prof Pap 521-A, pp A1-A61, 1969. 61 p, 20 fig, 5 plate, 8 tab, 124 ref.

Descriptors: *Hydrogeology, *Water resources, *Groundwater, *Arizona, *New Mexico, Colorado, Utah, Groundwater movement, Recharge, Discharge (Water), Transmissivity, Permeability, Specific capacity, Aquifers, Water wells, Water quality, Hydrologic data, Water levels.
Identifiers: Navajo-Hopi Indian reservation.

The Navajo and Hopi Indian Reservations have an area of about 25,000 sq mi and are in the south-central part of the Colorado Plateaus. The underlying sedimentary rocks range in age from Cambrian to Tertiary and the Igneous and metamorphic basement rocks are of Precambrian age. The climate varies widely, ranging from semiarid below 4,500 ft to relatively humid above 7,5000 ft. Precipitation has a strong and fairly uniform relation to altitude. The Colorado and San Juan Rivers are perennial, but most of other streams are ephemeral or intermittent. Nearly 1/6 of the area drains internally. The aquifers are composed of beds of sandstone and mudstone. The main aquifers are in the Coconino Sandstone, Navajo Sandstone, and the alluvium; but all other units locally yield some water to wells and springs. Coefficients of permeability are generally less than 10 gpd per sq ft, and many are less than 3 gpd per sq ft. Yields from wells in these aquifers usually are less than 25 gpm. Most specific capacities computed from tests of wells range from 0.3 to 5.0 gpm per ft of drawdown. The dissolved-solids content of 1,300 water samples analyzed ranges from 90 to more than 25,000 ppm. Water having the greatest amount of dissolved solids is in deep aquifers in the Black Mesa and San Juan basins. (Knapp-USGS)

GEOLOGY AND GROUND-WATER RESOURCES IN THE RALEIGH AREA, NORTH CAROLINA,
Geological Survey, Raleigh, N. C.
V. Jeff May, and J. D. Thomas.
NC Dep Water Resources Ground Water Bull 15, Nov 1968. 135 p, 26 fig, 32 tab, 23 ref.

Descriptors: *Water resources, *North Carolina, *Groundwater, Water wells, Water yield, Aquifers, Fractures (Geology), Permeability, Discharge (Water), Data collections, Hydrologic data, Water quality, Water levels.
Identifiers: Raleigh Area (NC).

Several towns and industries in the Raleigh area, N. C. obtain their water supplies from wells. Groundwater is the source for all private supplies. The permeability of the rock units depends largely upon the occurrence of secondary interstices such as fractures and cleavage planes. Because the nature and abundance of these interstices vary in the different rock types, the yields of wells differ greatly from place to place. The yield of wells in all of the metamorphic and igneous rocks, except greenstone, ranges from 12 to 22 gpm. Adequate domestic supplies and small to moderate industrial and municipal supplies are obtained from these rocks. Most wells in Triassic rocks yield less than 10 gpm. The average yield of wells in drawsgreater than twice the average yield of wells in other topographic locations. The permeability of the rocks decreases with depth. Generally, little water is contained in the rocks below a depth of 200 to 250 ft. Groundwaters in the Raleigh area are mostly calcium and sodium bicarbonate type waters. Some highly mineralized waters for this area are produced from the Triassic and metavolcanic rocks. The bromide concentration in groundwater is probably from residual sea water. The wells waters containing above-normal amounts of nitrate in the area have been polluted because of improper well casing. (Knapp-USGS)

ntifiers: Saline groundwater.

e altitude of the base of fresh groundwater in thern Oklahoma is shown by maps and cross tions in a 2-sheet hydrologic atlas. The base of h water was determined from electric logs of p wells, drillers' logs of water wells, and from lished reports. Its depth varies from within a feet of the surface to over 3000 ft below the face, and depends on the depth of the rocks, ir permeability and solubility and source of harge. Areas of deepest fresh water occur in derately to steeply dipping permeable rocks h large recharge capability. In poorly permeable ks, the fresh water-salt water interface is sharp, in more permeable rocks there is a broad dational zone. (Knapp-USGS)

ntifiers: Differential equations, Nova Scotia.

summary of a report on mathematical model ch determined the flow characteristics of an ifer was given. The unsteady flow of ground- er in an aquifer was described by elliptic and abolic partial-differential equations which could approximated by finite equations. The solution the finite difference equations for a non- nogeneous, anisotropic, leaky-artesian aquifer n irregular boundaries, differing boundary con- ons, and multiple variable-rate pumping (or harge) wells was discussed. The method used solving the equations in two-space dimensions n time was the alternating direction implicit nique. Several comparisons of the numerical tions versus analytical solutions were sented. Results of a digital analysis of an aquifer Musquodoboit Harbor, Nova Scotia, were sented. Several other applications were listed. It concluded that the numerical technique made sible rapid analysis of groundwater flow ems, and to use such models as a base from ch to optimize the total system. For main entry W69-07562. criptors: *Osmotic pressure, *Water chemistry, lutes, Moisture stress, Density, Soil water ement, Diffusion, Instrumentation, Tensiome- , Moisture tension.
ntifiers: Matric potential (Soil water), Salt ex- ion, Psychrometry.

A technique is described that uses the operating principles of the thermocouple psychrometer and the porous plate apparatus to measure the matric and osmotic potentials of soil water without extraction of a significant amount of soil solution. The technique was tested on a Na-saturated Gila soil to which NaCl solutions with osmotic potentials of -1, -2, and -6 bars were added. The standard error of measurement of the soil water potential components was about 0.04 bar. The measured osmotic potentials of the soil were lower than those of the added solutions, which can be explained by salt exclusion although mineral dissolution could contribute to these results. The technique also permitted measurement of the partial molar volume of soil water with an accuracy of about 1%. Within this precision, the partial molar volume of soil water in this study was shown to be the same as that of pure water. (Knapp-USGS)

EFFECTS OF SOIL PHYSICAL PROPERTIES, RAINFALL CHARACTERISTICS, AND WIND VELOCITY ON CLOD DISINTEGRATION BY SIMULATED RAINFALL,
Agricultural Research Service, Manhattan, Kans. Div. of Soil Erosion.
Leon Lyles, L. A. Disrud, and N. P. Woodruff.
Soil Sci Soc Amer Proc, Vol 33, No 2, pp 302-306, Mar-Apr 1969. 5 p, 4 fig, 9 tab, 9 ref.

Descriptors: *Infiltration, *Rainfall-runoff relationships, *Impact (Rainfall), *Puddling, *Soil structure, *Simulated rainfall, *Wind velocity, Soil texture, Runoff, Erosion, Permeability, Rainfall simulators, Hydraulic models.
Identifiers: *Clod disintegration, Raindrop energy.

The effects of clod size and density, rainfall intensity and duration, and wind velocity on clod disintegration by simulated rainfall were studied in a laboratory wind tunnel-raintower facility. Significant interactions (including those of higher order) were found among the variables studied. Clod bulk density had a minor effect on disintegration. For a specific clod size and wind velocity, 10-min rains at 5.61 cm/hr were about as destructive as 90-min rains at 1.60 cm/hr, even though the total volume of rainfall was 2.5 times larger in the latter case. Wind-driven rain was very effective in clod disintegration. Up to 66% more soil was lost from clods exposed to 13.4-m/sec winds than those exposed to no wind for the same rain intensity, duration of exposure, and clod size. Mean drop size striking the clods probably increases with wind velocity and would account for some of the wind effects. Small clods were more susceptible to disintegration by raindrop impact than large clods. Multiple regression analyses indicate about 80 and 89% of the soil detachment variance was accounted for by linear and curvilinear procedures respectively. (Knapp-USGS)

Identifiers: Aufwuchs group, Montana, Flathead Valley, Mission Valley, Chromogen, Stone, Gram stain, Carex sp, Potamogeton sp, Sedge, Arthrobacter.

Planktonic and benthic populations differ morphologically, especially in Gram reactions. Size and proportion of organism types in each group vary with environment changes. The Aufwuchs group, growing on stones, stumps, plants, and fish, resembles the planktonic more than the benthic. Bacteria in lakes (oligothrophic and eutrophic) and ponds (eutrophic or dystrophic) are compared. Surface water showed large fluctuations in the number of bacteria in proportion to chromogens. Areas within lakes, rather than lake types (oligotrophic or eutrophic) appeared significant. Benthic bacterial populations are in inverse proportion to depth of water above mud. Indications are that bacteria do not decompose materials as rapidly as they are being deposited. There seem to be autochthonous floras for water and mud. Although no distinct patterns of vertical distributions emerge, the surface contains the largest populations. Chromogens predominate at all levels. Red-pigmented and pink-pigmented organisms were most numerous in surface water. Gram-positive spore-formers were more frequent in mud than in water. Fish are carriers of bacteria. The alkalinity, inorganic and organic compounds, including vitamins, affect bacterial populations, B vitamins increasing the percentage of chromogens. Percentage of chromogens was an indicator of the planktonic group. For main entry see W69-07423. (Jones-Wisc)

Identifiers: *Mud-water exchange, Esthwaite water, Dissolved ions, Reduction potential, Artificial mud-water systems, Chemical stratification, Isopleths, Time-depth diagrams, Concentration gradient, Overturn.

Distribution of physical variables and dissolved substances in Esthwaite by depth-time are diagrammed. Vertical chemical stratification in water column suggests that main agents of production or depletion are located at mud's surface. Movement of water masses in hypolimnion is mainly horizontal and sufficient to maintain eddy diffusion coefficient and spread rate of dissolved substance exceeding molecular diffusion by 2000-fold. Hypolimnion activity in Esthwaite suggests an applicable hypothesis to lakes in which deoxygenation occurs. Oxygen depletion triggers nitrate reduction at an early stage. A second stage at redox approximately E-sub-7x 0.25 volt destroys insoluble ferric complexes existing at mud-water interface and liberates bases, including ammonia, ferrous iron, and other reducing materials. At third stage, ion concentrations increase gradually until oxygen is reintroduced at overturn. Depth-time of redox potential and electrical conductivity from two artificially aerated and anaerobic mud-systems were diagrammed to compare variations in dissolved substances. After oxidized surface layer disappeared in anaerobic tank, rapid rise in iron, ammonia, silicate, phosphate, alkalinity and conductivity occurred. In aerated tank, little change occurred in concentrations of dissolved substances apart from accelerated decrease of pH, alkalinity, nitrate, and ammonia, and subsequent slow rise in sulfate and conductivity. A THREE DIMENSIONAL STUDY OF PARAMETERS RELATED TO THE CURRENT DISTRIBUTION IN LAKE ROOSEVELT,
Battelle-Northwest, Richland, Wash. Pacific Northwest Lab.
Robert T. Jaske, J. C. Sonnichsen, and C. A. Oster.
Battelle Memorial Inst NW Lab Res Rep to OWRR, Dept of Interior, Apr 23, 1969. 93 p, 35 fig, 10 tab, 32 ref, 5 append. AEC Contract No. AT (45-1)-1831. Available from Clearinghouse as PB 184 700 at $3.00 in paper copy and $0.65 in microfiche.

Descriptors: *Lakes, *Reservoirs, *Currents (Water), *Density stratification, *Mathematical models, Computer programs, Density, Temperature, Turbulence, Current meters, Data collections, Remote sensing, Streamflow, Operations research, Systems analysis.
Identifiers: *Lake Roosevelt (Wash), Jet currents, Savonious current meter.

Research was undertaken to describe the physical relationship of the current field to the stratification pattern in Lake Roosevelt. The higher temperatures in the penstock discharge were related to the mean temperature of water in the entrance flow field. This condition persists for many miles upstream so that the mean temperature of the moving water mass is represented by a temperature from 10 to 20 m above the location of maximum current speed. A correlation of the position of the depth of the jet with the densimetric Froude number was obtained. The use of the Savonious rotor current meter was demonstrated to be appropriate for the flow field under study, with current speeds of from 0.025 to 0.35 knots. Second order instabilities in the current speeds were determined and standard deviation estimated, but no theory supporting the existence of these instabilities was advanced. A 2-dimensional, semi-empirical mathematical model was developed as a basis for further operations research. The relationship of the flow field at Lake Roosevelt to that of the Arrow Lakes was detailed, and distinct similarities were noted in portions of similar depth. A theory is proposed to guide computations of the depth of the flow field involved in the travel of surface water over a spillway or submerged obstacle. Computer program listings are included. CONSOLIDATION AND CEMENTATION OF RECENT SEDIMENTS IN THE ATCHAFALAYA BASIN,
Louisiana State Univ., Baton Rouge. Coastal Studies Inst.
Clara Ho, and James M. Coleman.
Geol Soc Amer Bull, Vol 80, No 2, pp 183-191, Feb 1969. 9 p, 5 fig, 2 plate, 6 ref.

Descriptors: *Sedimentation, *Diagenesis, *Consolidation, *Compaction, *Louisiana, Mississippi River Basin, Density, Porosity, Permeability, Analytical techqniques, Fluorometry, X-ray diffraction, X-ray fluorescence, Spectrophotometry, Nitrogen, Carbonates, Organic matter.
Identifiers: Atchafalaya River Basin (La).

X-ray radiography was utilized extensively in examining core slabs from a fresh-water clay sequence in the Atchafalaya River Basin, Louisiana. From the radiographs, detailed diagenetic features such as cementation by secondary precipitated minerals, pyrite and carbonate replacement of organic fragments, and progressive formation of nodules were revealed. Selected samples were analyzed by means of differential thermal analysis, X-ray diffraction, X-ray fluorescence, atomic absorption spectrophotometry, Kjeldahl method for total nitrogen and wet combustion for organic carbon. The diagenetic mineral accumulations consisted of calcium carbonate, ferric oxide, ferrous carbonate, and Mg and Mn compounds of unknown nature and have contributed significantly to the observed strength increase with depth. The dewatering process, commonly attributed solely to compaction resulting from overburden, may also be brought about by a gradual replacement of the pore-water space by secondary mineral accumulation. EXPERIMENTS ON FORMATION OF CONTORTED STRUCTURES IN MUD,
Geological Survey, Denver, Colo.; and Geological Survey of Israel, Jerusalem.
Edwin D. McKee, and Moshe Goldberg.
Geol Soc Amer Bull, Vol 80, No 2, pp 231-243, Feb 1969. 13 p, 8 plate, 2 tab, 41 ref.

Descriptors: *Sedimentary structures, *Mud, *Load distribution, Compaction, Silts, Faults (Geology), Movement, Diagenesis, Deposition (Sediments), Sedimentation, Model studies, Laboratory tests.
Identifiers: Contorted bedding.

Contorted structures can be formed in mud or sand as a result of differential loading. Experiments were conducted in water tanks to test various factors of possible significance in the contortion of mud by loading. The most significant of 6 factors tested was distribution of load, but others affecting the type of structure under certain conditions were the manner of depositing the mud, the form of the underlying surface, the direction of loading, and the m
ment or lack of movement of water during loa
Organic material was shown to be unnecessa
forming conical structure or convolute bed
Strength of base had little or no influence on
volute-structure development. Contortions ra
from the simple anticlinal type with vertical a
plane, commonly referred to as convolute, to st
tures with gently dipping axial planes, to ot
with lateral extensions or 'flames' from the ape
and, finally, to those with complex overtur
folds. Causes of these variations were determi
in terms of the factors listed. Some additional fo
of contorted bedding result from other type
penecontemporaneous deformation such as slu
ing from undermining or from oversteepening,
ferential lateral movement, and surface drag; th
forms differ from those structures formed by lo
ing.

River, Mineralogy, Provenance, Weathering, Se
ment transport, Statistical methods, Correlati
analysis.
Identifiers: Discriminant analysis.

The relative amounts of montmorillonite, illite, a
chlorite-kaolinite in the bottom sediments w

considerably between the reservoirs of the Columbia River. The relative fractions of montmorillonite increase progressively downstream; illite shows an inverse trend; the amounts of chlorite-kaolinite remain consistently low throughout the river. Discriminant function analyses indicate significant differences in 3 areas of the Columbia River based on the variability of clay minerals in 6 groups of samples from reservoirs: Grand Coulee in the upper reaches, Rocky Reach, Wanapum, and Priest Rapids in the min-reaches, and Bonneville, Dalles, McNary, and Ice Harbor in the lower reaches of the river. Samples from tributaries of the lower Columbia River differ significantly from all other groups. The presence and distribution of 2 distinct types of weathering environments within the Columbia River Basin may account for some of the agreement between observed clay mineral fractions and those predicted from source area evaluations, and they may confirm the reliability and sensitivity of the discriminant analysis in distinguishing between 2 groups on the basis of clay mineral variability. The use of the discriminant function analysis in clay mineral studies is potentially valuable for vertical as well as horizontal correlation. (Knapp-USGS)

TIDAL FLAT SEDIMENTATION ON THE COLORADO RIVER DELTA, NORTHWESTERN GULF OF CALIFORNIA,
Humboldt State Coll., Arcata, Calif.
Robert Wayne Thompson.
Geol Soc Amer Mem 107, 1968. 133 p, 35 fig, 25 plate, 16 tab, 64 ref, 1 append. API Project 51.

Descriptors: *Deltas, *California, *Sedimentation, *Colorado River, Alluvial channels, Currents (Water), Tides, Waves (Water), Winds, Coasts, Flood plains, Sedimentology, Sands, Silts, Tidal marshes.
Identifiers: Baja California (Mex), Tidal flats.

Barren mud and salt flats form a low-lying coastal plain at the northwestern end of the Gulf of California. The region is arid, and characterized by a maximum spring tide range of 8 to 10 m. The sequence of sediment types includes chaotic muds and evaporites, moderate brown, well-laminated clayey silts, brown to gray mottled silty clays, and gray, poorly laminated silty clays and clayey silts. The silts and clays are derived from suspended load of the Colorado River, and are carried to the site of deposition by Gulf tidal currents. The high mud flats developed by depositional regression. Mud supply diminishes toward the south, and wave effects are accentuated accordingly. Coarse sand is carried northward to form prominent longshore spits which finger out into the intertidal muds. Sediment supply has been much reduced for the past 50-60 yr due to diversion of the Colorado River into the Salton Sea and the subsequent construction of Hoover Dam. Consequently, waves have winnowed the poorly segregated mud-flat deposits, piled coarse mollusk remains into beach ridges fringing the northern high flats, and developed a fine sand and shell veneer over the intertidal zone. Older beach ridges, now largely encased by intertidal muds, record an earlier period of low mud supply and reworking which was probably initiated 1000 to 1500 years B.P. by diversion of the Colorado River into the Salton Basin to the north. EROSION CONTROL AT HOLLINGER MINE TAILING SITE,
Hollinger Consolidated Gold Mines Ltd., Timmins (Ontario).
J. M. Gordon.
Can Mining J, Vol 90, No 6, pp 46-50, June 1969. 5 p, 5 photo, 1 tab.

Descriptors: *Erosion control, *Planning, *Plant growth, Grasses, Trees, Sludge, Sewage disposal, Cost analysis, Moisture, Seasonal, Slopes, Swamps.
Identifiers: *Canada, Tailings erosion control, Canadian mine-erosion control.

The best method of protection from erosion of the Hollinger Mine tailings was investigated by planting grass and trees (poplar, jackpine, black spruce, etc.) on the slopes and plateau of the tailing deposit of 70 to 90 ft above the original low-lying ground. The article contains the following brief chapters: (1) long-term planning; (2) erosion control of slopes; (3) erosion control of the plateau; (4) description of grasses; (5) method of seeding and seed mixture; (6) method of planting trees and type of nursery stock used; and (7) concluding remarks. The results of the application of grass and tree planting to the tailings deposit can be considered as entirely satisfactory because grasses and trees are growing on the slopes and the 100-ft-high plateau is gradually becoming parkland. ORGANIC MATTER IN THE GLACIOMARINE SEDIMENTS OF THE EASTERN ANTARCTIC,
Akademiya Nauk SSSR. Institut Geologii i Razrabotki Goryuchikh Iskopaemykh.
O. K. Bordovskiy.
Oceanology of the Academy of Sciences of the USSR, AGU, Washington, D. C., Vol 8, No 1, pp 54-60, 1968. 7 p, 1 fig, 3 tab, 13 ref.

Descriptors: *Antarctic, *Glacial drift, *Glaciers, *Sediment transport, *Organic matter, Sands, Clays, Bituminous material, Humus, Icebergs, Benthic fauna, Biomass, Nitrogen, Oxygen.
Identifiers: Eastern Antarctic, Glaciomarine Antarctic sediments.

Distribution and composition of organic matter in the recent glaciomarine Antarctic sediments is analyzed on the basis of the analysis of samples collected by the first Soviet Antarctic expedition on the Motor Vessel Ob; and using earlier publications. The study shows that the organic matter of glaciomarine sediments of eastern Antarctic is typified by a number of features also found in the organic matter of other marine sediments. Some specific features affecting the Antarctic bitumens are apparently due to the nature of sedimentation, namely the dominant role of benthic filter-feeding organisms in the sedimentation of organic matter. (Gabriel-USGS)

NATURAL AND MAN-MADE EROSION IN THE HUMID TROPICS OF AUSTRALIA, MALAYSIA AND SINGAPORE,
Hull Univ. (England). Dept. of Geography.
Ian Douglas.
Comm of Surface Waters, Proc Gen Assembly of Bern (Sept-Oct 1967), Int Ass Sci Hydrol, Pub No 75, pp 17-30, 1967. 14 p, 6 fig, 6 ref.

Descriptors: *Erosion, *Tropical regions, *Rain forests, Humid climates, Weathering, Residual soils, Accelerated erosion, Floods, Sediment yield, Hydrogeology.
Identifiers: *Australia, *Malaysia, *Singapore.

Under natural rain forest conditions in the humid tropics there is a striking contrast between the great depth of weathered rock material and soil, often exceeding 30 m, and the very small concentrations of suspended and dissolved matter carried in stream waters. The dense forest vegetation which exists in a delicate ecological balance with the soil, exerts a protective effect against mechanical processes such as raindrop splash and slope wash, but favors the chemical attack on minerals. Variations in the nature of the vegetation cover affect the rate of erosion under natural conditions. Once the vegetation is removed the rate of erosion is greatly increased. Comparisons between rates of erosion determined on headwater streams, where interference is minimal, and at stations further downstream, where considerable human activity affects river behavior, are used to illustrate the effects of forestry, grazing, tree crops, cultivation, mining, and urban development. A great volume of erosion occurs during the construction stage when large areas of soil are left exposed to the effects of splash and surface runoff. These conditions provide very rapid rates of runoff to streams, producing much higher flood peaks than occur natural under conditions with consequent damage to stream banks and riverine structures. More permanent are the effects of changes in land use of river regimes and on the course of erosion. With increasing human occupance of the catchment areas of the humid tropics, erosion becomes concentrated into short duration flood events which may cause disruption to river users and flood plain dwellers in the lower parts of the catchment areas. (Knapp-USGS)
W69-07539

EROSION OF GRANITE TERRAINS UNDER TROPICAL RAIN FOREST IN AUSTRALIA, MALAYSIA AND SINGAPORE,
Hull Univ. (England). Dept. of Geography.
Ian Douglas.
Comm of Surface Waters, Proc Gen Assembly of Bern (Sept-Oct 1967), Int Ass Sci Hydrol, Pub No 75, pp 31-40, 1967. 10 p, 1 tab, 8 ref.

Descriptors: *Erosion, *Weathering, *Tropical regions, Rain forests, Humid climates, Residual soils, Sediment yield, Hydrogeology, Water quality, Water chemistry.
Identifiers: *Australia, *Malaysia, *Singapore.

Observations of streams draining tropical rain forest covered granite catchments in Singapore, West Malaysia, and Northeast Queensland, Australia reveal that while dissolved solids concentrations and suspended sediment concentrations are always low (usually less than 50 ppm and 100 mg/l respectively) the total loads carried by streams under natural, undisturbed conditions may be fairly high, up to 100 cu m/sq km/yr when the mean annual rainfall is around 4,000 mm. Despite the common assertion that the humid tropical environment favors chemical weathering, more of the total load evacuated from the catchments studied is carried as suspended matter than in solution, because of the supply of fine colloidal clay particles to the streams by subsurface movement of drainage water in the soil profile and by the undercutting of stream banks. Small streams containing a lot of organic matter, and probably deriving most of their flow from groundwater and soil water have a pH between 5.7 and 6.4, whereas those flowing more rapidly with sandy or boulder beds have a pH between 6.5 and 7.5. Silica is the main dissolved constituent, concentrations varying from 6 to 32 ppm, depending on discharge and on the degree of incision of the stream channel into the deep mantle of weathered rock. The more readily soluble materials such as calcium and magnesium form a higher proportion of the dissolved content of drainage waters than of the rock from which they

LIBRARY U. OF I., URBANA-CHAMPAIGN

are derived, demonstrating their preferential removal from the granite. (Knapp-USGS)

BED LOAD TRANSPORT AT FLOOD TIME,
Szkola Glowna Gospodarstwa Wiejskiego, Warsaw (Poland). Dept. of Hydraulics Engineering.
J. Skibinski.
Comm of Surface Waters, Proc Gen Assembly of Bern (Sept-Oct 1967), Int Ass Sci Hydrol, Pub No 75, pp 41-47, 1967. 7 p, 4 fig, 8 ref.

Descriptors: *Sediment transport, *Bed load, *Floods, Streams, Non-uniform flow, Hydraulic models, Flumes, Sedimentation rates, Sediment discharge, Sedimentology.
Identifiers: Flood wave, Bed load transport.

With the same flow volume, the intensity of bed load transport is greater in the rising phase of the flood wave than in the falling phase. This affects bed load calculations for floods and total bed load tranport. Tests were made in a flume 23 m long and 0.60 m wide, with a sand bed 0.25 m deep. The sand-grain representative diameter was 0.414 mm. Water flow varied between 0.009 to 0.120 cu m/sec. Mean velocities were from 0.088 to 0.795 m/sec with water depths from 0.05 to 0.40 m. Tests were run with rising wave to falling wave ratios of 1:1.93 and with constant water depths of 0.10 to 0.40 m. Formulae were derived relating bed load transport to velocity and water depth. Results of tests are shown grapically. (Knapp-USGS)
W69-07541

EFFECT OF RECENT CRUSTAL MOVEMENTS ON THE SHAPE OF LONGITUDINAL PROFILES AND WATER LEVELS IN RIVERS,
Akademiya Nauk URSR, Kiev. Instytut Geologichnykh Nauk.
N. G. Volkov, I. L. Sokolovsky, and A. I. Subbotin.
Comm of Surface Waters, Proc Gen Assembly of Bern (Sept-Oct 1967), Int Ass Sci Hydrol, Pub No 75, pp 105-116, 1967. 12 p, 5 fig.

Descriptors: *Erosion, *Degradation (Stream), *Land subsidence, Geomorphology, Structural geology, Terrain analysis, Profiles, Water levels.
Identifiers: Tectonic movements, Geologic uplift.

Breaks in the longitudinal profiles of streams may be caused by tectonic movements as well as by the influence of tributaries or the composition of the rocks the river is eroding. To calculate the effects of tectonic movements, a theoretical profile of the river shape may be calculated and compared with the actual shape. With a long enough record, changes in stage at constant discharge give a measure of degradation or aggradation caused by uplift or subsidence. An analysis of discharge data from over 130 gaging stations in the USSR shows that crustal movement calculated by degradation rate compares with the rate of recent crustal movements obtained by surveying methods. COARSE BEDLOAD AS A FACTOR DETERMINING BED SLOPE,
David N. Wilcock.
Comm of Surface Waters, Proc Gen Assembly of Bern (Sept-Oct 1967), Int Ass Sci Hydrol, Pub No 75, pp 143-150, 1967. 8 p, 3 fig, 1 tab, 7 ref.

Descriptors: *Sediment transport, *Bed load, *River beds, *Channel morphology, *Particle size, Hydraulic gradient, Velocity, Discharge (Water), Turbulence, Hydraulics, Regime, Streamflow.
Identifiers: River bed morphology, River bed slopes.

Field tracer studies were undertaken to assess the part played by coarse bedload in determining the characteristics of bed slope at 21 sampling stations within the upper 20 sq mi of the upper Hodder catchment, Northeast Lancashire, England. Bedload sampling was based on linear transects of the stream, and description of the size characteristics upon the log normal distribution. Bed slope was surveyed at every reach by quickest level after the passage of a bankfull flood, and this slope was designated as the 'normal' slope of the reach under present discharge/sediment conditions. Statistical tests of slope/geometric mean particle size relationships were made. Lithology was seen to exert little effect on any relationship, and Hack's 1957 formula was confirmed as the one of most general applicability. Competence tests on 1,000 tracer pebbles allowed the calculation of critical shear stress for different size categories, from which it was possible to calculate for each of the 21 stations the bankfull competence, and residual bedload at each station. Bed slope was found to correlate logarithmically with the median of this residual bedload fraction, (r) exceeding 0.9. Implications of the work involve the concept of bed slope as either a relic feature, or as a function of bedload possibly supplied under present-day conditions but subject to diminuation only in situ. The attraction of such a relationship is that it introduces a dynamic aspect into the problem of bed slope, as opposed to the rather static explanations previously invoked. Some channel shape control is also implied. (Knapp-USGS)

THE EFFECT OF MORPHOLOGICAL PROCESSES IN ALLUVIAL CHANNELS ON FLOW CONDITIONS,
Hydraulic Research Inst., Prague (Czechoslovakia).
Jaroslav Martinee.
Comm of Surface Waters, Proc Gen Assembly of Bern (Sept-Oct 1967), Int Ass Sci Hydrol, Pub No 75, pp 243-249, 1967. 7 p, 5 fig, 1 tab, 4 ref.

Descriptors: *Bed load, *Sediment yield, *Channel Morphology, *Stage-discharge relations, Regime, Sediment load, Alluvial channels, Channel flow, Sands, Sediment transport, Roughness (Hydraulic), Discharge measurement.
Identifiers: Streambed morphology, Rating curves.

The continuously changing sandy bed in alluvial channels has a substantial influence on flow conditions. A series of experimental measurements was carried out in a representative river reach in order to study the effect of ripples and sand transport on flow resistance. The shape of river bed forms was measured in a broad range of discharges and the traveling velocity of sand ripples calculated to estimate the total volume of sediment transport. The correct stage-discharge relation gradually deviates from values which would be calculated for the basic river bed roughness. This difference can be as high as 50% of the expected value. The height of ripples increases with the growing discharge. In a representative river reach it corresponded roughly to one-fifth of the respective water depth and similar ratios have been observed at other sites. A substantial increase of flow resistance is caused by the effect of sand ripples and sand transport, reducing the channel capacity to one-half of the value predicted only by the grain size of the bed material. A considerable shifting of discharge rating curves must be expected, and is shown by comparison of measurements in the representative river reach over an 11 year period. (Knapp-USGS)

otosynthetic bacteria are classified according to gment, usual electron donor, respiratory etabolism, and growth factor requirements. Feaes in common are: polar flagella, possession of hydrative type of glucose splitting, and otosynthetic metabolism similar to photosynthe- of green plants. Morphologically and physiologily grouped with Pseudomonas, they occur in ds in freshwater and marine environments under ht and anaerobic conditions. Major importance their use in the study of photosynthesis rather an as metabolizers of problem molecules from mestic or industrial waste. Their photometabol- results in assimilation, especially of lowolecular-weight carbon- and sulfur-containing olecules. Bacteria cannot carry out rapid converns and would be overgrown by aggressive terotrophs. If attractive to some protozoan or ner grazing fauna, they might be significant in nitary microbiology. The nutrients they assimie form solely new cellular material. In light, they verse the effect of the majority of microorganns which specialize in decomposition and assimie carbohydrates completely. Significant is their echanism, localized in the cell membranes, for tting energy from light with the chlorophyll, rotenoids, cytochromes, quinones, as do the gher plants. They all metabolize gases, carbon, drogen, and nitrogen in the light, and some etabolize oxygen in the dark. For main entry see 69-07423. (Jones-Wisc)

To determine resistance of synthetic materials in marine environments, marine borers were studied under natural exposure conditions and bacteria under laboratory conditions. In marine situations, over seventy materials (600 individual specimens) were exposed. Deterioration was confined primarily to attack by marine borers. Most plastic materials resisted borers and microorganisms, except the poly (vinyl chlorides) and polymides, half of which types were penetrated by pholads. Rubber samples showed evidences of borer penetrations and surface cracking. Polymide fibers apparently resist borers and microorganisms better than treated natural fibers. Polyethylene has shown negligible deterioration both in laboratory and ocean exposures. Castings resins resisted bacterial attack but were penetrated by pholads. Susceptibility of elastomers in laboratory studies indicates that bacteria may be implicated in the surface cracking phenomenon, appearing on ocean exposure specimens after seven years. Synthetic cellulosic fibers are degraded in ocean environment by borers and microorganisms, and preliminary laboratory studies indicate some susceptibility to bacteria. Although gross observations of poly (vinyl chlorides) subjected to ocean environments reveal no signs of microbial activity, laboratory studies provide ample evidence that these materials, depending upon formulation, can be utilized by bacteria under certain optimum conditions. IRON AND MANGANESE BACTERIA,
Illinois Univ., Urbana. dept. of Microbiology.
R. S. Wolfe.
Proc Rudolfs Res Conf, Rutgers Univ, New Brunswick, NJ. Principles and Applications in Aquatic Microbiology, Heukelekian, H and Dondero, Norman C (eds), John Wiley and Sons, New York, pp 82-97, 1964. 13 fig, 1 tab, 24 ref.

Descriptors: *Bacteria, *Iron, *Manganese, Oxidation, Water works, Electron microscopy, Springs, Seepage, Nutrient requirements, Pollutants, Iron oxides, Physiological ecology, Acidity, Acid mine water, Enzymes, Electrochemistry, Biochemistry, Metabolism, Estuarine environment.
Identifiers: Gallionella, Ferrous ions, Ferric hydroxide, Flagella, Micrographs, Leptothrix ochracea, Leptothrix major, Leptothrix discophora, Leptothrix trichogenes, Sphaerotilus natans form eutrophica, Chlamydothrix sideropus, Leptothrix sideropus, Clonothrix fusca, Thiobacillus ferrooxidans, Ferrobacillus ferrooxidans, Ferrobacillus sulfooxidans, Crenothrix polyspora, Taxonomy, Chlamydobacteria, Manganese oxide, Autothrophy, Morphology, Adenosine triphosphate.

Species of iron and manganese bacteria are separated taxonomically by biochemical behavior, especially ability to oxidize iron and manganese, and by cell depositions and structures. Iron bacteria are gradient organisms, establishing themselves at a propitious point between the source of ferrous ions and the air, and are found especially in estuarine environments, natural iron springs, seepages, and acid mine drainage. Studied with the electron microscope, the twisted stalks, composed of strands of ferric hydroxide, and flagella are found in Gallionella. The sheath-forming iron bacteria, like hollow iron pipes with ferric hydroxide, are controversial. The diversities of form may depend upon nutrients, thus sheaths may not be found in yeast extract-tryptone medium. Slime formation was observed in a medium containing 0.5 percent peptone. Some have empty sheaths and no cells; others, long filaments and large cells; or short brittle sheaths, mostly empty. Crenothrix polyspora has round non-motile, conidia-like cells derived from rod shaped cells. Two essentials for autotrophic existence to be explained are: adenosine triphosphate must be obtained for driving synthetic reactions, and the organism must obtain reducing potential for the reduction of carbon dioxide to the carbohydrate level. The enzymic steps in iron oxidation remain to be demonstrated. For main entry see W69-07423. (Jones-Wisc)

AMORPHOUS CLAY FRACTION OF SOILS AND ITS ADSORPTIVE PROPERTIES. A SELECTED BIBILOGRAPHY,
Wisconsin Univ., Madison. Dept. of Soil Science.
D. A. Graetz.
Scientific Information Program in Eutrophication, Wisconsin Univ, Madison, Document No 308064, 11 pp, Feb 1969. 140 ref.

Descriptors: *Adsorption, *Clays, *Soils, Chemical analysis, Insecticides, Sediments, Soil chemistry.
Identifiers: Chemical composition.

This bibliography contains 140 references relating to the noncrystalline clay fraction of soils and sediments, and should be of value to anyone working on their characterization. The difficulty in isolation of these materials has meant that they have been largely overlooked although, in many sediments, they may comprise a sizeable portion of the total. Also included are some references bearing on adsorptive properties of these amorphous minerals, particularly as regards insecticide adsorption. (Konrad-Wisc)

AN INVESTIGATION OF THE INTERRELATIONSHIP OF ORGANIC MATTER ,AND TRACE ELEMENTS IN FRESH WATER,
Rhode Island Univ., Kingston. Water Resources Center.
James T. Corless.
Completion Report OWRR Project A-013-RI, 1968. 25 p.

Descriptors: *Trace elements, *Organic matter, *Copper, *Water analysis, *Ponds, *Brackish water.
Identifiers: *Organo-metallic compounds, *Anoxic zone.

The distribution of copper in an unpolluted natural water system was investigated. Samples were taken from a fresh water pond and its downstream brackish water extension, containing an underlying saline, anoxic (H_2S detectable) basin. Neutron activation analysis was used to determine total copper, organic copper, and copper extractable with organic solvents. This was done for the particulate, colloidal and dissolved ranges of the water samples. Copper concentrations were variable in the pond and brackish river waters during the study period. A hypothesis was developed to relate some of the changes in the pond's copper concentrations to fluctuations in rainfall. Variations in copper distribution between the three different particle size ranges and their organic content were observed. Most of the copper detected in the anoxic zone appeared to be associated with particulate organic material that had precipitated out of the overlying waters. Organic solvents yielded evidence of three different organo-copper compounds existing in the three environments sampled. (Thompson-Rhode Island Univ0

BIOCHEMICAL RELATIONSHIPS AND INORGANIC NITROGEN EQUILIBRIUM IN SEMI-ENCLOSED BASINS,
Swedish Oceanographic Inst., Goteborg.

LIBRARY U. OF I., URBANA-CHAMPAIGN

R. Sen Gupta.
Tellus, Vol 21, No 2, pp 270-281, 1969. 12 p, 5 fig, 3 tab, 13 ref.

Descriptors: *Pollutants, *Biochemistry, *Nitrogen, *Lake basins, Oxidation, Lagoons, Anaerobic bacteria, Nitrates, Sulfates, Equilibrium, Hydrogen, Phosphates, Hydrologic data, Fjords, Statistical methods, Life cycles.
Identifiers: Semi-enclosed basin biochemistry.

A state of equilibrium of the inorganic nitrogen compounds in anoxic basins was investigated on the basis of concentration measurements of nitrate-, nitrite-, and ammonia-nitrogen using the pE parameter. The study shows that in narrow basins and under oxidation conditions the system nitrite-nitrate is found to approach certain equilibrium values. From the proximity of the calculated values to the equilibrium values the system nitrate-nitrite-ammonium appears to exist at least in partial equilibrium in marine environments independent of the general equilibrium condition controlled by the system hydrogen-hydrogen-ion-water. SOLUBILITY OF ALUMINUM IN THE PRESENCE OF HYDROXIDE, FLUORIDE, AND SULFATE,
Geological Survey, Washington, D. C.
C. E. Roberson, and J. D. Hem.
Geol Surv Water-Supply Pap 1827-C, 1969. 37 p, 18 fig, 5 tab, 19 ref.

Descriptors: *Water chemistry, *Aqueous solutions, *Solutes, *Solu bility, Aluminum, Fluorides, Sulfates, Ions, Temperature, Pressure, Free energy, Thermodynamics, Mineralogy.
Identifiers: Aluminum hydroxides.

The total concentration of aqueous dissolved species of aluminum that will be present in equilibrium with microcrystalline gibbsite at various levels of complexing ligand concentration are shown graphically. The graphs can be used to estimate aluminum solubility, at 25 deg C and 1 atmosphere total pressure, when the pH of the solution, its ionic strength, and the total sulfate and fluoride concentrations are known. The standard free energy of formation of cryolite calculated from solubility experiments is -745.4+ or minus 1.0 kcal per mole at 25 deg C. Diagrams are included showing the solubility of cryolite in terms of aluminum, fluoride, and sodium concentrations. The stability fields of cryolite and microcrystalline gibbsite and their solubilities also are shown on pH- (F) diagrams. (Knapp-USGS)

CHEMICAL EQUILIBRIUM BETWEEN GYPSUM AND BRACKISH AND SLIGHTLY SALINE WATERS AT LOW TEMPERATURE AND PRESSURES,
Bordeaux Univ. (France). Hydrogeological Centre.
J. A. Cherry.
Chem Geol, Vol 3, No 4, pp 239-247, Dec 1868. 9 p, 3 fig, 5 tab, 20 ref.

Descriptors: *Water chemistry, *Gypsym, *Equilibrium, Chemical potential, Sulfates, Ionization, Solubility, Aqueous solutions, Solutes, Saturation, SOLVATION.
Identifiers: Ionic activity coefficients.

The solubility product of gypsum was calculated from free energy of reaction and used to evaluate the procedure of Garrels and Thompson for calculating ionic species in natural waters of brackish to slightly saline composition. It was found that cumulative errors in the method are appreciable. With routine water analyses and our present knowledge of dissociation constants and activity coefficients, we must allow a broad interval of possible saturation values. (Knapp-USGS)
W69-07518

PREVENTION OF ADSORPTION OF TRACE AMOUNTS OF GOLD BY CONTAINERS,
Geological Survey, Denver, Colo.
T. T. Chao, E. A. Jenne, and L. M. Heppting.
Geol Surv Res 1968, Prof Pap 600-D, pp D16-D19, 1968. 4 p, 4 fig, 4 ref.

Descriptors: *Sampling, *Water analysis, *Adsorption, *Trace elements, *Gold, Aqueous solutions, Treatment.
Identifiers: Sample preservation.

Loss of significant parts of trace amounts of gold by adsorption on container walls, during sample transport and storage, poses a major problem in quantitative determinations of gold in natural water. Experiments using gold-198 as a tracer indicate that gold may be kept in solution for 21 days by (1) acidification of a test solution to pH 1 with hydrochloric acid to and addition of between 5 to 50 mg/1 of bromine, (2) acidification with hydrochloric acid to 1N without bromine, and (3) acidification with nitric acid to 2N or 3N. After 21 days, radioactive decay reduces gamma radiation of gold-198 beyond the limits of accuracy of available equipment and no information was obtained. Addition of 50 mg/1 of bromine to a nonacidified test solution of pH 6 is almost as effective. In contrast to nonacidification, moderate acidification of the test solution to pH 2 or 3 with hydrochloric and acetic acids, as well as acidification to pH 1 with nitric acid, enhances gold adsorption. The pH 1 hydrochloric acid and 50 mg/1 bromine combination is as effective in desorbing gold from container walls as it is in preventing gold adsorption. (Knapp-USGS)
W69-07531

ADSORPTION OF TRACES OF SILVER ON SAMPLE CONTAINERS,
Geological Survey, Denver, Colo.
T. T. Chao, E. A. Jenne, and L. M. Heppting.
Geol Surv Res 1968, Prof Pap 600-D, pp D13-D15, 1968. 3 p, 2 fig, 12 ref.

Descriptors: *Sampling, *Water chemistry, *Adsorption, *Trace elements, Water analysis, Aqueous solutions.
Identifiers: Sample preservation, Silver.

Special care is required to prevent container adsorption of significant parts of the trace amount of silver present in most natural waters. The use of strong acids appears to be the most effective means of retaining the silver in solution. Lowering the pH of the water samples to 1 with either hydrochloric or nitric acid reduced adsorption onto polyethylene containers to approximately 1% of the silver present. Silver adsorption after 30 days of contact time amounted to 4 and 10% of the silver present at pH 2 when adjusted with hydrochloric acid and nitric acid, respectively. Adjustment of the pH to 1 with either hydrochloric or nitric acid was effective in desorbing silver from polyethylene containers in the course of several days. (Knapp-USGS)

TIDAL WAVE CALCULATIONS FOR VARIOUS RIVER REGULATION STAGES DEMONSTRATED BY EXAMPLE OF THE LOWER WESER AND THE LOWER HUNTE RIVERS (German),
Paul Strohmer.
Deut Gewasserkundliche Mitt, 13 Jahrgang, Heft 2, pp 48-54, Apr 1969. 7 p, 8 fig, 1 tab, 15 ref.

Descriptors: *Rivers, *Tidal waters, *Mathematical studies, Flow resistance, Sun, Moon, Dynamics, Topography, Surveys, River beds, Discharge coefficients, Velocity, Estuary, Water level fluctuations.

Tide-wave phenomena were investigated analytically and experimentally using the hydrologic and topographical data recorded along the lower reaches of the Weser and Hunte rivers of Western Germany. The study shows that reliable calculation of tide-wave parameters requires a sufficiently accurate estimate of flow resistance phenomenon. This accurate estimate, however, is based on a careful analysis of known regulation stages. (Gabriel-USGS)

LANDWARD TRANSPORT OF BOTTOM SEDIMENTS IN ESTUARIES OF THE ATLANTIC COASTAL PLAIN,
Geological Survey, Woods Hole, Mass.
Robert H. Meade.
J Sediment Petrol, Vol 39, No 1, pp 222-234, Mar 1969. 13 p, 9 fig, 1 tab, 65 ref.

Descriptors: *Sedimentation, *Estuaries, *Atlantic Coastal Plain, *Sediment transport, Currents (Water), Tidal effects, Tides, Bed load, Sands, Aggradation, Movement, Provenance, Sediment distribution, Aquatic drift, Deposition (Sediments).
Identifiers: Tidal currents.

The estuaries of the Atlantic Coastal Plain are being filled with sediment. River-borne sediment is partially trapped in the estuaries by the predominantly landward flow of estuarine bottom waters. The main evidence of this is measurements of the sediment flux (suspended-sediment concentration and water velocity measured at intervals of depth and through tidal cycles) that show sediment being moved progressively landward along the bottom. Comparisons of the loci of sediment deposition and the patterns of water circulation show that sediment accumulates in estuaries near the upstream limit of landward bottom flow. The movement of sands into the mouths of the larger estuaries from the continental shelf and nearby beaches is also suggested by several other lines of evidence. Bottom waters of the continental shelf move progressively into the mouths of estuaries, and they presumably carry bottom sediments with them. Beach sands move toward and into the mouths of some estuaries at rates of several hundred thousand cubic meters per year. Distinctive mineral components in the lower reaches of estuaries suggest that the bottom sediments were derived from offshore. The rates of filling of the estuaries are different in the northern and southern parts of the Coastal Plain. The large northern rivers carry disproportionately small loads of sediment that have not yet filled the deep valleys which were cut during the ice ages. The southern rivers carry large sediment loads relative to the sizes of their valleys and consequently their estuaries are mostly filled with sediment.

DAL STREAM ACTION AND SEA LEVEL IANGE AS ONE CAUSE OF VALLEY MEAN-RS AND UNDERFIT STREAMS,
wcastle Univ. (Australia). Dept. of Geography.
F. Geyl.
stralian Geogr Stud, Vol 6, pp 24-42, 1968. 19 7 fig, 1 tab, 32 ref.

scriptors: *Streams, *Valleys, *River basins, leanders, Stream erosion, Streambeds, Stream-w, Tides, Sea level, Estuaries.
ntifiers: *Underfit streams, Sea level changes.

a level change is proposed as a cause of underfit eams for coastal plain streams as well as for ny cases of underfitness that cannot be ex-ined by climatic change. Lowering of relative level has caused the replacement of large-charge tidal streams by small-discharge ordinary ers, the one-time tidal channels thus becoming leys, or valley bottoms, now modified in varying gree by sub-aerial processes since emergence. me cartographic and morphometric evidence in pport of this tidal hypothesis is presented. Un-fitness would appear to occur in equatorial re-ns as well as in the climate zones to which Dury uld limit the phenomenon. Topographic maps of nganyika, Ghana, Nigeria and elsewhere give the pressinon that valley meanders are to be found re. This is to be expected on the tidal hypothes-as sea level changes would have affected all sts. Much more research, and field work in par-ular, will have to be done before this tidal pothesis can be firmly established. That climate ange has occurred and has affected river charges and fluvial landforms is not denied. But t sea level changes have occurred is equally cer-n. A general theory of underfit streams based ly on climate change does not seem satisfactory. napp-USGS)

YDROLOGY OF NEOGENE DEPOSITS IN IE NORTHERN GULF OF MEXICO BASIN,
uisiana State Univ., Baton Rouge.
ul H. Jones.
lletin GT-2, Apr 1969, La Water Resources search Inst. 105 pp, 36 fig, 4 tab, 93 ref, 4 app.

scriptors: Hydrogeology, *Aquifers, *Pore pres-re, Permeability, Clay minerals, *Diagenesis, mbrane processes, *Osmosis, Ion exchange, hermal water, Connate water, *Salinity, Sedi-ntation, Dehydration, Water of crystallization, lf of Mexico, Gulf Coastal Plain, Heat flow.
ntifiers: Neogene deposits, Geothermal adient.

e Neogene deltaic and neritic marine deposits in northern Gulf of Mexico Basin form regional uifer systems in which pore pressures, salinities, d temperatures do not compare with those in older sedimentary basins. Rapidly buried sand and clay sequences, sealed off by growth faults, remain undercompacted and contain abnormally high fluid pressures (up to 0.96 times the overburden pressure). Such high pressures force saline formation water toward normally-pressured aquifers. The intervening clay beds act like membrane filters to freshen the water, which subsequently dilutes the receiving aquifers. High pressures and trapped radiogenic heat cause diagenesis of montmorillonite to illite. The released fresh water of crystallization either remains in the transformed clay under high pressure, because the adjacent sand beds are already geopressured, or flows to and dilutes normally-pressured aquifers. Osmotic pressures, which are generated by the membrane-like clays and which may be responsible for halting or even reversing these flows, are considered the dominant factor in the preservation of abnormal high pressures. Salinities vary from a few hundred to 300,000 mg/l at any depth below 6,000 feet. Generally decreasing salinities are evident below 12,000 feet. (Hill-Louisiana State Univ)

MIXING OF COLUMBIA RIVER AND OCEAN WATERS IN SUMMER,
Washington Univ., Seattle. Dept. of Oceanography; and Smithsonian Institution, Washington, D. C.
T. John Conomos, and M. Grant Gross.
ASCE Proc, J Sanit Eng Div, Vol 94, No SA5, Pap 6187, pp 979-994, Oct 1968. 16 p, 10 fig, 22 ref.

Descriptors: *Estuaries, *Columbia River, *Mixing, *Sea water, *Streamflow, *Pacific Ocean, Nutrients, Dissolved solids, Salinity, Currents (Water), Water quality, Circulation, Eddies, Salinc water-freshwater interfaces.
Identifiers: Upwelling (Water).

Mixing between Columbia River water and the adjacent ocean water is a 2-stage process controlled primarily by high river discharge. The first-stage mixing, of fresh water of the river and upwelled deeper ocean water, occurs within the estuary and yields low-salinity water. The second-stage mixing, of seaward-flowing low-saline water and deeper ocean water, occurs primarily in the transition area within 20 km of the river, and adds additional nitrate and phosphate. During summer the river is the dominant contributor of dissolved silicate. Because of summer photosynthetic depletion, the river contributes virtually no nitrate; the deep ocean water contributes most of the phosphate and nearly all the nitrate. In the oceanic area, the low-salinity surface water lies above the surface ocean water which inhibits further upward nutrient transfer by mixing. Nitrate is depleted within 30 km of the river. The lack of nitrate therefore limits photosynthetic activity in the surface ocean layers. (Knapp-USGS)
W69-07523

DYNAMIC DIVERSION: INFLUENCE OF LONGSHORE CURRENT-TIDAL FLOW INTERACTION ON CHENIER AND BARRIER ISLAND PLAINS,
California Univ., Davis. Dept. of Geology; and California Univ., Bodega Bay, Calif. Bodega Marine Lab.
Thomas W. Todd.
J. Sediment Petrol, Vol 38, No 3, pp 734-746, Sept 1968. 13 p, 2 fig, 27 ref.

Descriptors: *Sedimentation, *Beaches, *Deltas, *Tidal effects, *Littoral drift, Mississippi River, Gulf of Mexico, Ocean waves, Tides, Currents (Water), Intertidal areas, Bed load, Suspended load, Hydraulics.
Identifiers: *Chenier plains, Mississippi delta, Barrier islands.

Chenier and barrier island plains are characteristic products of post-Pleistocene sedimentation along the northern and western coasts of the Gulf of Mexico, but similar features may be recognized throughout the world. These plains have been formed by net progradational displacement of the sea throughout the latest 3,000 to 5,000 yr period of sea level stability. They consist of low, narrow, well-sorted shell and sand ridges that are elongate parallel with the former shoreline, and which are separated by tidal mud flats or zones of poorly sorted, fine sand. A correlation has been established in the vicinity of the Mississippi River delta, by means of radiocarbon dating, between low rate of fine sediment discharge into westward moving longshore currents, stability or minor recession of the downdrift shoreline, and slow accretion of well-sorted chenier beach ridge sand. High rate of sediment discharge into nearshore currents, however, coincides with rapid progradation of sandy, silty mudflat deposits along the downdrift shoreline. It is suggested that the presence of a high content of fine sediment in longshore currents changes their fluid dynamic characteristics in such a way as to enhance traction transport, inhibit separation of differing grain size modes, and thus promote deposition of unsorted detritus. Light sediment loads halt rapid progradation and induce reworking of previously accumulated sediment. Thus no change in general wave regime is required to account for alternation of chenier sand accumulation with interchenier mudflat deposition. (Knapp-USGS)

SEDIMENTARY PROCESSES OPERATIVE ALONG THE WESTERN LOUISIANA SHORELINE,
Continental Oil Co., Ponca City, Okla.
Arthur O. Beall, Jr.
J. Sediment Petrol, Vol 38, No 3, pp 869-877, Sept 1968. 9 p, 10 fig, 12 ref.

Descriptors: *Sedimentation, *Gulf of Mexico, *Beaches, *Louisiana, Tidal effects, Currents (Water), Littoral drift, Mississippi River, Ocean waves, Bed load, Suspended load, Hydraulics, Provenance.
Identifiers: Tidal currents.

Investigation of modern facies relationships along the southwestern Louisiana shoreline demonstrates the complex interaction of sediment supply and energy of coastal processes. Shallow water 'wave energy' and proximity to suspended mud supply are qualitatively shown to be dominant variables. Facies tracts show variation through a broad spectrum of geometries and sediment types. Mudflats, both intertidal and subaqueous, show highest rates of progradation, as compared to 'normal' sand-rich beaches with low rates of progradation. An intermediate type of strandline, represented by a thin sand beach resting on eroded mudflat and marsh sediment, is shown to prograde at rates intermediate between those of mudflats and normal beaches, even though geometrical relationships would suggest retrogradation. Consideration of the interaction of various partially dependent sedimentary processes outlined in this paper can be used to characterize rates of progradation as well as to predict sediment type and geometry. SUBMERGENCE ALONG THE ATLANTIC COAST OF GEORGIA,
Geological Survey, Richmond, Va.
Robert L. Wait.
Geol Surv Res 1968, Prof Pap 600-D, pp D38-D41, 1968. 4 p, 3 fig, 1 tab, 5 ref.

Descriptors: *Submergence, *Atlantic coastal plain, *Georgia, Subsidence, Estuaries, Radioactive dating, Carbon radioisotopes.
Identifiers: Glynn County (Ga), Brunswick River, Turtle River.

Cypress stumps recovered from river terrace material near Brunswick, Ga., may indicate submergence of the Atlantic coastal area during Holocene geologic time. The older material, found at a depth of from 9 to 17 ft below mean sea level, was dated by carbon-14 at 3, 670z or minus 300 years (B. P., 1950); the younger, found 1 ft above mean sea level and buried in 3 ft of marsh silt and clay, was dated at 2,780 and or minus 250 years B.P. Presence of the cypress stumps may indicate that fresh water once discharged from the Turtle River, now a drowned estuary. (Knapp-USGS)

THE PATTERN OF SEDIMENT MOVEMENT IN THE RIVER TYNE,
Department of Water Resources (England). Devon River Authority.
David G. Hall.
Comm of Surface Waters, Proc Gen Assembly of Bern (Sept-Oct 1967), Int Ass Sci Hydrol, Pub No 75, pp 117-142, 1967. 26 p, 16 fig, 2 plate.

Descriptors: *Sediment transport, *Sedimentation, *Estuaries, Tides, Currents (Water), Sediment load, Sediment yield, Sediment discharge, Streamflow.
Identifiers: River Tyne (England).

The movement of sediments in the River Tyne and the Tyne estuary, northeast England, was studied in conjunction with a survey of the tidal hydraulics of the estuary. The mean annual discharge of the river is 1,452 cfs. Suspended load was estimated to be 132,000 tons per yr and bed load, 20,000 tons per yr. The amount entering from the sea is estimated from dredging records to be 120,000 tons per yr. Currents and sites of deposition are shown by maps and sections. (Knapp-USGS)

03. WATER SUPPLY AUGMENTATION AND CONSERVATION

3A. Saline Water Conversion

SCALE REDUCTION IN DESALINATION BY CALCIUM SULFATE SOLUBILITY INVERSION,
Rhode Island Univ., Kingston. Water Resources Center.
A. Ralph Thompson.
Completion Report OWRR Project A-012-RI, 1968. 16 p.

Descriptors: *Desalination, *Scale prevention, *Evaporation, *Additives, *Solubility, *Calcium Sulfate, *Heat transfer.
Identifiers: *Acrylic acid-amide copolymers, *Polyhall 295, *Sodium acrylate, *Cyanamer P35, *Polyacrylamides.

The purpose of this research was to find a method for reducing or eliminating calcium sulfate scale in saline water conversion processes by employing distillation or evaporation. The principle of the proposed method depends on the use of the additives to sea water which would give calcium sulfate a normal rather than inverted solubility behavior so it would not tend to deposit on heat transfer surfaces. After determining extensive data on almost fifty compounds, only three were found which, in relatively low concentrations, had the characteristics of holding the transient solubility of calcium sulfate in sea water practically invariant with temperatures up to about 255 deg. F. These compounds were (1) sodium acrylate (2) an anionic polyacrylamide and (3) an acrylic acid-amide copolymer. Tests run in an experimental evaporator using 10 - 20 p.p.m. of these promising additives showed remarkable reduction in scale formation on heat transfer surfaces. Preliminary economic evaluation indicated that the cost of additives may be reduced to one or two cents per 1000 gallons of fresh water produced.

SALINE WATER CONVERSION REPORT FOR 1968,
Office of Saline Water, Washington, D. C.
W. S. Gilliam.
Office Saline Water 1968 Rep, 1969. 489 p, 404 fig, 97 tab, 314 ref, 6 append.

Descriptors: *Desalination, *Research and development, Membrane processes, Desalination processes, Water purification, Aqueous solutions, Thermodynamics, Byproducts, Corrosion, Electrochemistry, Potable water, Saline water, Water chemistry, Distillation.
Identifiers: Office of Saline Water.

Desalination research, while maintaining a program of basic studies relevant to desalting, continues to emphasize applied research and the development of desalting technology. During 1968, the major portion of the research effort was concentrated in the fields of membrane technology, materials, design, and configuration studies of prototypes involving tubes, spirals, and composites for membrane processes and basic and exploratory research. It is believed the need for increased emphasis on these activities, plus a much greater effort in the fields of pretreatment of feed water, contaminated water, biomembranes, mineral recovery, new processes, and others, will be essential in the next few years. Research continues to emphasize the development of less costly materials having a potential for reduction of plants costs. The principal objective of the program is the development of the lowest cost desalination processes possible for use under a variety of conditions. Research progress during calendar 1968 is summarized in the reports of the five operating research divisions: Polymer and Biophysics, Applied Science, Materials, Chemical Physics, and Chemistry. ON THE OPTIMAL DESIGN OF DESALIN
TION PLANTS,
Kansas State Univ., Manhattan.
L. T. Fan, L. E. Erickson, C. Y. Cheng, and C. L.
Hwang.
Proc, Nat Symp Anal Water-Resource Syst, pp 3
63, Denver, July 1968. 27 p, 13 fig, 6 tab, 28 ref.

Descriptors: *Desalination plants, *Optimizatio
*Design, Flash distillation, Reverse osmosis, Wat
supply, Water treatment, Mathematical mode
Economic justification, Operating costs, Constru
tion costs, Simulation analysis.
Identifiers: Multieffect multistage flash distillatio
Search techniques.

The optimal design of desalination plants w
described as one aspect in the optimization
water resource systems. Two investigations invo
ing the optimization of a multieffect, multista
flash distillation process and a reverse osmo
process were summarized to illustrate systems an
ysis procedures and to illustrate the results o
tained from that type of investigation. In order
optimize the process design, a mathematical mod
related the design variables to the behavior of t
physical system, an economic model related t
design variables to capital and operating costs,
objective function (minimization of water produ
tion cost) and an optimization procedure wa
used. It was demonstrated that a combined o
timization technique based on a discrete analog
the maximum principle and search techniques su
as the parametric search and gradient techniqu
were quite efficient for the study of a multista
multidecision process. Some composite desalin
tion systems which were currently being
vestigated were introduced. For main entry s

e evolution of equipment development is ex-
ined, as is moisture retention properties, in-
ases in crop yields and economics of asphalt
isture barriers (AMB). The AMB machine
unted on a TD-25C gear driven crawler tractor
h a crew of two men is expected to lay from 1.0
1.5 acres of barrier per hr. at a depth of 2 ft.
duction of infiltration rate from 3 in. to about
in per hr. has been demonstrated. In Arizona ir-
ation usage was reduced to 47% of the control
t. The barrier without irrigation produced better
p yields than the irrigated control, and
quently better than irrigated barrier plots. The
ncipal cost is asphalt. Under present U.S.
nomic conditions a barrier can be installed for
0 to $300 per acre. The payout for the farmer
be from one to four years, and the barrier could
fifteen years. (Sherbrooke-Ariz)

ization, Deserts, Basins, Runoff, Standing
ers, Surface-groundwater relationships,
salination, Stockwater, Water consumption.
ntifiers: *U.S.S.R.

e area of the U.S.S.R's arid zone is about 3
ln. sq. km. Development depends on the use of
sit streamflow, underground water, and
cipitation. Traditional methods (i.e. wells) of
derground water use are very limited by high
nity. Surface runoff collection by native popula-
ns in floating freshwater lenses on saline ground-
er and modern efforts are considered. Each 100
km of pasture with 1,500 sheep needs only 0.04
km. of artificial drainage area with an annual ru-
f of 75 mm. Stock can consume mineralized
er, and procurement of freshwater for man is no
blem. The upper salinity limit for stock water is
000-15,000 p.p.m. and for irrigated cultivation
stock fodder is 10,000-15,000 p.p.m. Large
shwater lenses have been discovered and
nomic methods of underground water intake
e introduced, preventing salt water intrusion. A
thod of natural freezing desalination is men-
ied. Acceptability of total river runoff utiliza-
n, and its resulting consequences in the large
er drainage basins that form the Caspian Sea,
Aral Sea and other isolated waters, is presently
ng debated in the U.S.S.R. (Sherbrooke-Ariz)

ps, Soil moisture.
ntifiers: *Evapotranspirometers.

ree years of observations on water use by salt-
dar, conducted in a battery of evapotranspirome-
(tanks), resulted in reliable answers to
estions of phreatophyte waste. The quantity of
ter evaporation or transpiration depends on the
pth of groundwater. It also depends on the salini-
f the soil moisture. In soils which have an elec-
al conductivity of saturation extract of 30 mil-
limhos, water use is half that of those having 10 mil-
limhos. With low salinity of soil moisture salt cedar
sprouts grow faster than under high salinity condi-
tions. Growth characteristics between controlled
and thinned-out stands are not significant. Thin-
ning and cutting are shown to be ineffective
methods of saving water. Under favorable condi-
tions shoots can increase by as much as 50 mm per
day. Methods of vegetation survey and extrapola-
tion of water use as measured in evapotranspirome-
ters to a 100% density can seriously overestimate
water use as a 75% cover density may use as much
water as 100%. Programs of saltcedar eradication
along dry river beds with water table at 4 meters for
the purpose of saving water are seriously
questioned as to effectiveness. (Sherbrooke-Ariz)

WATER RESOURCES OF THE BIG OTTER CREEK DRAINAGE BASIN,
Water Resources Commission (Ontario).
U. Sibul.
Ontario Water Resources Comm, Water Resources
Rep 1, 1969. 91 p.

Descriptors: *Water resources, *Groundwater,
*Surface waters, Water wells, Water quality,
Aquifers, Glacial drift, Water yield, Water levels,
Discharge (Water).
Identifiers: *Ontario, Big Otter Creek Basin.

Field investigations were made of surficial geology,
surface-water flows, and farm water use in the Big
Otter Creek Basin, Ontario. Observation wells were
installed and water samples were collected for
chemical analysis. A simplified hydrologic budget
is presented. The only area in the basin where there
is difficulty in obtaining sufficient ground-water
supplies of acceptable quality is in the southern
portion. Ground-water supplies in the rest of the
basin are derived from sand and gravel aquifers and
water-bearing zones in the upper portions of the
bedrock. Most of these waters are of good quality
for domestic, stock and irrigation purposes. Sur-
face-water supplies are utilized mostly for irriga-
tion, and at most locations are adequate in quantity
and quality. Stream runoff, composed to a large
degree of ground-water discharge, is the main
source of surface-water supply. The withdrawal of
water during short periods of irrigation in July and
August has a marked effect on the streamflow of
Big Otter Creek. In the 1964-65 water year, total
precipitation for the basin was 30.81 inches, or
6.85 inches below the normal. Stream runoff was
15.10 inches, and evapotranspiration was 15.71
inches. The water resources were found to be
generally adequate for the present uses in the basin;
however, local shortages and quality problems exist
and require special development and management
practices. (Knapp-USGS)

Geol Surv Hydrol Invest Atlas HA-307, 3 sheets,
1969. 31 fig, 14 maps, 2 tables.

Descriptors: *Water resources, *Surface waters,
*Groundwater, *Minnesota, Streamflow, Runoff,
Water levels, Water wells, Aquifers, Glacial drift,
Sands, Gravels, Recreation, Irrigation water, Water
quality, Water utilization.
Identifiers: Buffalo River Watershed (Minn).

The water resources of the Buffalo River
watershed, west-central Minnesota are described in
a 3-sheet hydrological atlas consisting of maps,
graphs, charts, and text. The annual runoff ranges
from 0.7 to over 3.2 inches and averages 1.4
inches. All but 1 of the communities of the area use
groundwater. Irrigation water is obtained from
streamflow, and more could be developed with
reservoirs. Flooding is caused mainly by snowmelt
and spring rains. Most groundwater is obtained
from glacial drift aquifers; supplies are adequate
for domestic and stock use everywhere, and large
supplies may be obtained from sand and gravel len-
ses. Water quality is suitable for most uses. Runoff
data are summarized by hydrographs. Surficial
geology, water use, streamflow, aquifers, water
yields, water levels, water quality, and recreational
use are shown by maps. (Knapp-USGS)

*Groundwater, *Minnesota, Streamflow, Runoff,
Water levels, Water wells, Aquifers, Glacial drift,
Sands, Gravels, Recreation, Irrigation water, Water
quality, Water utilization.
Identifiers: Otter Tail River Watershed (Minn).

The water resources of the Otter Tail River
watershed, west-central Minnesota are described in
a 4-sheet hydrological atlas consisting of maps,
graphs, charts, and text. Large amounts of ground-
water are available from sand and gravel deposits
along the Otter Tail River. Yields of over 1,000
gpm are available. Most of the water has low sodi-
um hazard and medium salinity hazard, and is suita-
ble for irrigation on most soils. Average runoff is
1.9 in per year. Flooding is minor and usually
caused by ice jams. Water based recreational op-
portunities are very good, particularly for canoe-
ing. Runoff data are summarized by hydrographs.
Surficial geology, water use, streamflow, aquifers,
water yields, water levels, water quality, and
recreational use are shown by maps. (Knapp-

Identifiers: *Saline agriculture, *Marine agriculture.

This is a review of the authors' and others' work, with recommendations for worldwide implementation. About 40 economic species have been grown with saltwater up to oceanic concentration, in various countries, and more than 250 species with saline waters, mainly desert underground waters with a total salt concentration of 2,000 to 10,000 p.p.m.T.D.S. Recent experiments proved that seedlings will grow at higher salt concentrations than before thought when many varieties of each species are tested. Fresh water for germination and growth of seedlings is advisable, but more study is needed on salt-sensitivity stages of cultivated plants. Juncus arabicus germinates in waters up to 9,000 p.p.m. chlorine. Juncus seedling growth is enhanced under plastic cover because the tiny plants are sheltered against wind, benefit from higher temperature, and if irrigated with saline water, have freshwater from the dropping air moisture. Desert underground waters have a lower salinity than sea water, but a less favorable ionic balance. Evaluation is made of the ecological and physiological approaches to problems of arid lands agriculture. New principles are listed. Programs are outlined for the utilization of these findings on a worldwide scale. (Sherbrooke-Ariz)

Identifiers: San Luis Unit, Central Valley Projec (Calif), San Joaquin Valley (Calif).

The San Luis Unit of the Central Valley Project c California now under construction by the Bureau of Reclamation will provide for irrigation develop ment of arid lands whose water supply is in adequate to support existing agriculture. Variou considerations of water management that relate t the project are discussed and pertinent data ar presented. Environmental features are discussed i sufficient detail to indicate some of the principl considerations in water quality management. Con trasting conditions are presented for permeabl well-drained and slowly permeable poorly-draine soils. Surface and groundwater criteria for mixin are discussed. Problems in prediction of salt bui dup and salt balance under a mixing regime ar considered. Mixing of irrigation water and disposa of drainage effluent are discussed in relation to th project. paper reports on experiments employing drip
ation in the Arava desert region of Israel. The
nod is based on the lateral spread of water by
duction under pressure and application through
ial nozzles placed on a plastic conveyor pipe
above the ground in close proximity to the
ts. Experimental crops included musk melons,
atoes, cucumbers, sweet corn and peppers.
of growth under trickle irrigation surpassed
under sprinkler irrigation. This led to earlier,
ell as higher, yields with reduced production
, particularly water. Picking costs were
ced by uniform ripening and early market
es were higher. In many cases, under trickle ir-
ion, the salt concentration was the lowest
ible under the specific prevailing conditions of
e water and saline soils of the area. Values for
ride content in plant leaves under trickle irriga-
were between 40 to 60% of those for sprinkler
ation. With very low rates of application the
r supply very nearly equals the amount ac-
y used by the plant. (Sherbrooke-Ariz)

EVALUATING RANGELAND WATER QUALITY WITH SMALL PLOT INFILTROMETERS,
Utah State Univ., Logan. Dept. of Watershed Science; and Intermountain Forest and Range Experiment Station, Ogden, Utah.
Gerald F. Gifford, and Ronald K. Tew.
J Soil and Water Conserv, Vol 24, No 2, pp 65-67, Mar-Apr 1969. 3 p, 1 fig, 2 tab, 2 ref.

Descriptors: *Infiltrometers, *Water quality, *Range management, Brush control, Clear-cutting, Irrigation practices, Runoff, Infiltration, Arid lands.
Identifiers: Rocky Mountain infiltrometer.

Use of small plot infiltrometers allows collection and analysis of both applied and runoff water in evaluating rangeland water quality changes caused by agricultural disturbance of soil. In experimental plots, a natural cover of pinyon and juniper was removed by chaining and debris was cleared in one plot, another was chained but not cleared, and a third plot was left undisturbed. A Rocky infiltrometer was used to apply high intensity rainfall on each plot at over 2.7 in/hr. Significant changes in Ca and K concentrations resulted from land treatment. The pH of all runoff from treated plots decreased, and electrical conductivity increased. There was no relationship between runoff water quality and volume or duration of runoff. (Knapp-USGS)

PRINCIPLES AND METHODS OF CAPACITY DETERMINATION IRRIGATION DISTRIBUTION SYSTEMS,
Middle East Technical Univ., Ankara (Turkey).
Korkut Ozal.
Middle East Tech Univ, Fac of Eng Publication No 22, Jan 1965. 138 p, 55 fig, 29 tab, 128 ref.

Descriptors: *Irrigation systems, *Irrigation design, *Irrigation water, *Water supply, Mathematical studies, Water demand, Evapotranspiration, Water circulation, Climates, Dynamics, Economic aspects, Plants, Soils, Water loss, Frequency, Probability, Experimental farms.
Identifiers: *Irrigation distribution systems, Irrigation system design, Irrigation system analysis.

After stating that the capacities of irrigation canals are determined by several parameters, such as the type of crops under cultivation, the soil, the type of irrigation system used, etc., the author develops a detailed analysis of these parameters mainly based on the analytical and experimental studies conducted by several earlier investigators. The book contains 128 references and consists of the following chapters: (1) introduction; (2) a review of the factors that affect system capacities (water requirements of plants, soil characteristics, system losses, system operation, economic aspect); (3) the principles of system designs (general, water duty, system flexibilities); and (4) conclusions. REDUCTION OF WATER APPLICATION LOSSES THROUGH IMPROVED DISTRIBUTION CHANNEL DESIGN,
Oklahoma Agricultural Experiment Station, Stillwater.
James E. Garton, and John M. Sweeten, Jr.
Technical Completion Report, Water Resources Research Institute, August 19, 1968. 53 p, 5 tab, 12 fig, 16 ref. OWRR Project No. A-004 Okla.

Descriptors: *Irrigation canals, *Irrigation design, *Laboratory tests, Furrow irrigation, Irrigation engineering, Hydraulic engineering, Open channels, Mannings equation.

These studies were directed toward improving the uniformity of application of water with furrow irrigation. Increased efficiency of application can best be achieved by improving uniformity. Values of Manning's n were obtained with gradually varied flow in a level ditch without siphon tubes with different diameters, spacing, and submergence. Relationships of Manning's n to the variables were determined. The tubes were primed and values of Manning's n were determined for various diameters, spacing, and submergence with spatially varied flow. The results of these studies were used to determine the uniformity of water application which could be expected with various ditch slopes and outlet arrangements. A method was derived for calculating the water surface elevations at various points in a level distribution bay without resorting to a computer solution. Various diameters of circular weirs and orifices were studied to determine the head-discharge relationship for weirs with a 45 degree slope operating as side discharge devices. Rectangular weirs of various length were studied to determine the head-discharge relationship for weirs with a 45 degree slope.

Descriptors: *Irrigation, *Irrigation engineering, *Crop production, Rainfall, Climatic zones, Water resources, Water supply, Precipitation (Atmospheric), Topography, Temperature, Soils, Mapping, Rivers, Dams, Mineral industry, Sugar crops, Watersheds (Basin), Economics.
Identifiers: Rhodesian lowveld irrigation.

After describing the geology and history of the development of the irrigation system in the lowlands of Rhodesia located in the southeastern strip bordered by Transvaal and Mozambique the author discusses the present status of agriculture and land irrigation existing in the lowlands. The future dam construction and irrigation projects to increase the agricultural economy of the area are also briefly discussed. (Gabriel-USGS)

WATER CONSERVATION AND IRRIGATION AGENCIES.

Ala Code tit 12, secs 297 (1) -- 297 (14) (Supp 1967).

Descriptors: *Alabama, *Water conservation, *Irrigation programs, *Irrigation districts, Legislation, Administrative agencies, Local governments, Contracts, Bids, Water supply, Impoundments, Wells, Flood control, Surplus water, Multiple purpose projects, Water rates, Water users, Taxes, Permits, Erosion control, Water management (Applied), Water resources development, Eminent domain, Soil erosion.

A state development agency, constituting an irrigation district, is authorized in the interest of conservation and irrigation. Counties may elect to become a part of the agency, the membership of which shall consist of title holders of land to be irrigated. The method of incorporating the agency and the procedures to be followed in its operation are provided. Among the power of the agency are the powers: (1) to contract; (2) to sue and be sued; (3) to enter agreements with the United States concerning water impounded by it; (4) to acquire pro-

perty; (5) to provide a water supply; (6) to develop and operate an irrigation project; (7) to provide for flood control; (8) to provide multiple purpose developments; (9) to establish rates for water sold; (10) to tax water users; (11) to control soil erosion and silt; and (12) to exercise the right of eminent domain. Prior to any construction, the department of conservation must issue a permit. Contracts for construction and purchases of materials are to be awarded on the basis of competitive bids. Bonds may be issued for the purpose of finance. (Childs-Fla)

FLOOD PLAIN INFORMATION OF SOUTH FORK PALOUSE RIVER AND MISSOURI FLAT CREEK, PULLMAN, WASHINGTON.
Corps of Engineers, Walla Walla, Wash.

Corps Eng Flood Plain Rep, Apr 1969. 34 p, 11 fig, 13 plate, 3 tab.

Descriptors: *Floods, *Flood damage, *Washington, Flood plains, Flood control, Non-structural alternatives, Maximum probable flood, Historic flood.
Identifiers: Pullman (Wash), Palouse River (Wash), Missouri Flat Creek (Wash), Standard project flood, Intermediate regional flood.

Flooding of the South Fork Palouse River and Missouri Flat Creek, Pullman, Washington is described in a report of flood plain problems based on records of rainfall, runoff, and historical and present flood heights. Maps, photographs, profiles, and cross sections indicate the extent of flooding that has occurred and which may be expected to occur in the future. The information is for use in study and planning ways to minimize vulnerability to flood damages by control of flood plain use by zoning and subdivision regulations, the construction of flood protection works, or by combinations of these approaches. MAN-MADE LANDFORMS IN THE NILE DELTA,
Texas Univ., Austin. Dept. of Geography.
Robert K. Holz.
Geogr Rev, Vol 59, No 2, pp 253-269, Apr 1969. 17 p, 12 fig, 19 ref.

Descriptors: *Deltas, *Land forming, *Topography, *River basin development, *Geomorphology, Human population, Agriculture, Climates, History, Maps, Deserts, Gaging stations, Precipitation (Atmospheric), Rice, Cotton, Fruit crops, Evapotranspiration, Soils, Water table.
Identifiers: *Egypt, Nile delta koms.

This paper describes the low mounds, the so-called koms, of the Nile delta, which are the accumulated debris of thousands of years of human occupation. After giving the recent map of the Mendes site, the author discusses the delta and kom landscapes, their vegetation, soil, water table, and human occupance. The author summarizes his study by stating that the koms stand out in the landscape as distinct units, both physically and culturally, and that a sharp contrast between the unirrigated koms and surrounding lush vegetation constantly reinforces the delta farmer's awareness of his dependence on the waters of the Nile River. SOME ENVIRONMENTAL EFFECTS OF DRAINAGE IN FLORIDA,
Central and Southern Florida Flood Control District, West Palm Beach.
William V. Storch, and Robert L. Taylor.
ASCE Proc, J Irrig and Drainage Div, Vol 95, No IR1, Pap 6460, pp 139-151, Mar 1969. 13 p, 6 fig.

Descriptors: *Drainage, *Wetlands, *Florida, *Environmental effects, Citrus fruits, Economics, Estuaries, Flood control, Irrigation, Sedimentation, Water quality, Fish, Ecology, Plants, Social aspects, Conservation, Public rights.
Identifiers: Lake Okeechobee-Everglades Basin (Fla).

In 1959, intensive agricultural development started in a 780 sq mi region lying east of Lake Okeechobee in south Florida. In this 'wetland' region of flats, sloughs and ponds effective drainage to coastal waters has been the key to agricultural expansion. By 1967 approximately 20% of the region was planted in citrus. Changes in the natural environment within the region took place almost immediately after drainage was initiated and indicates that the natural environment in adjacent areas can be affected as well. The effect of drainage on the immediate economic environment of the region has been favorable to date. However, natural environmental changes have produced tensions, with economic overtones, in the social environment resulting in conflict between agricultural and conservationist interests. Based on the experience gained in this region it is suggested that the proper function of public government is to evaluate the possible environmental effects of drainage programs and to use its financial, persuasive and regulatory powers to guide total environmental change in accordance with its estimate of the best public interest. (Knapp-USGS)

SPATIAL ORDER IN FLUVIAL SYSTEMS: HORTON'S LAWS DERIVED FROM MIXED HEXAGONAL HIERARCHIES OF DRAINAGE BASIN AREAS,
Harvard Univ., Cambridge, Mass. Computer Graphics and Spatial Analysis Lab.
Michael J. Woldenberg.
Geol Soc Amer Bull, Vol 80, No 1, pp 97-111, Jan 1969. 15 p, 3 fig, 6 tab, 44 ref, 1 append.

Descriptors: *Drainage density, *Drainage patterns (Geologic), *Mathematical models, Geomorphology, Computer models, Digital computers, Streams, Streamflow, Hydraulics, Thermodynamics, Entropy, Topography.
Identifiers: Hortons law, Topology, Allometric growth, Geometry.

The number of stream basin areas (that is, the number of Strahler stream segments) is predicted on the basis of a hexagonal model for basin areas. It is suggested that the number of orders and the number of basins per order balance opposing tendencies for minimum overland work for streams flowing in small basins and maximum work savings in large, as opposed to small, channels. In addition, the entropy of the system approaches the maximum possible. The model agrees with empirical data in cases where the land surface is reasonably uniform with regard to structure and lithology. The necessity for approximate geometric progressions of basin areas with order creates geometric progressions of other basin parameters, leading directly to the power function relationships between variables known as allometric growth. This model is identical to one proposed to explain the numbers of market areas per order in a system of cities. (Knapp-USGS)

WATER RESOURCES COMMISSION.
Conn Gen Stat Ann secs 25-7a to 25-9 (1958), as amended, (Supp 1968).

Descriptors: *Connecticut, *Water pollution, *Flood control, *Water policy, Wells, Water utilization, Administrative agencies, Channels, Channel improvement, Coasts, Tidal waters, Navigation, Navigable waters, Shore protection, Beach erosion, Legislation, Legal aspects, Water resources development, Water supply, Permits, Gaging stations.

Approval of the commission is required before any public water system may sell its water reserves in excess of those required to maintain an adequate supply. The commission is authorized to regulate the erection of structures and work incidental thereto in the tidal, coastal, or navigable waters of the state with due regard to prevention or alleviation of shore erosion, land development, and improvement of navigation. The commission may establish seaward boundaries beyond the high water mark along tidal and coastal waters for regulation of use and for providing small boat basins. Permits from the commission are required for construction along tidal or coastal waters. The commission is directed to establish and operate stream gauging stations for water resource investigation, and is authorized to permit municipalities to divert water from any river for public or domestic use. Persons engaging in well drilling operations must register with the commission. (Kelly-Fla)

THAMES RIVER VALLEY FLOOD CONTROL COMM'N.
Conn Gen Stat Ann secs 25-101 to 25-102 (1958).

Descriptors: *Connecticut, *Interstate compacts, *Flood control, *Interstate rivers, Legislation, Reservoirs, Reservoir sites, Damsites, Taxes, River basins, United States, Financing, Administration, Legal aspects, Massachusetts, Project purposes, Cost sharing, State governments.

The governor of Connecticut is authorized to enter into a compact with Massachusetts for the purpose of assuring adequate storage capacity for impounding the waters of the Thames River for the protection of life and property from floods. The Thames River Valley Flood Control Commission is created and is to consist of 6 members, 3 from each state. The powers of the Commission are enumerated. The Commission shall develop a plan for flood control and for utilization of the water resources of the Thames River Valley. The credit of the signatory states shall not be pledged by the Commission. Massachusetts has agreed to the construction by the United States of four dams and reservoirs in the Thames River Valley. Connecticut agrees to reimburse Massachusetts for 40 percent of the amount of taxes lost by reason of acquisition and ownership by the United States of lands for construction of the four dams or any other flood control dam hereafter constructed. If Massachusetts acquires lands for flood control purposes and is not fully reimbursed by the United States, Connecticut shall pay its share of the excess cost as determined by the Commission. Procedure for appointing 3 commissioners and their respective tenures is provided for in the act. (Holt-Fla)
W69-07601

NORTHEASTERN WATER AND LAND RESOURCES COMPACT.
onn Gen Stat Ann secs 25-120 to 25-121 (1958).

Descriptors: *Connecticut, *Interstate compacts, *Water resources development, *State governments, Legislation, Interstate commissions, Water policy, Interagency cooperation, Water resources, Water management (Applied), Federal government, Natural resources, Water sources, Employment, Contracts, Administrative agencies, Investigations, Surveys, Project planning.
Identifiers: Constitutionality.

The northeast section of the United States is a vast area of natural resources which may be exploited effectively only through a coordinated plan of action involving all the states in the area. The purpose of this compact is to create the Northeastern Resources Commission which, it is hoped, will provide such management. While studying, investigating and planning the development of water resources, the Commission will recommend changes in law or policy to promote coordination and resolution of problems. The Commission may request funds from both the signatory states and the federal government. The Commission may contract with public or private agencies to do research. The Commission may sue and be sued. The compact shall not affect any other compact into which a party state may have already entered, nor shall it discourage additional compacts. This compact shall become effective when accepted by any three of the following states: Connecticut, Massachusetts, Maine, New Hampshire, Rhode Island, or Vermont. Thereafter, any other northeastern state may become a party by enacting the compact into law. Renunciation and withdrawal by a party state must be preceded by three year's written notice of the intention to withdraw. Such notice should be sent to the governors of the party states. The provisions of the compact are severable and the invalidity of any one provision shall not affect the validity of the act as a whole. (Stewart-Fla)

APPROPRIATION OF WATERS; RESERVOIRS AND DAMS.

Md Ann Code, Art 96A:10-21 (1957), as amended, (Supp 1968).

Descriptors: *Maryland, *Water utilization, *Water permits, *Permits, Water management (Applied), Water allocation (Policy), Consumptive use, Administrative agencies, State governments, Dams, Reservoirs, Dam construction, Reservoir construction, Obstruction to flow, Alteration of flow, Legal aspects, Legislation, Farm ponds, Appropriation.
Identifiers: Penalties, Injunctions.

In Maryland, it is unlawful for the state or any agency thereof, person, business firm, or any state political subdivision to appropriate any state waters without the written consent of the Department of Geology, Mines, and Water Resources. Such consent is not required if state water is used for domestic and farming purposes, approved municipal water supply, and non-abandoned uses in existence on January 1, 1934. A permit is required with certain exceptions concerning size from the Department for the construction or alteration of any reservoir, dam, or waterway. Farm ponds and ponds constructed as farm ponds must meet certain

LIBRARY U. OF I., URBANA-CHAMPAIGN

specifications in order to be exempt. Permits are also required for the construction and alteration of conduits, pipe lines, and similar devices beneath the Potomac River. Public hearings will be set on all permit applications, and limitations, concerning the date construction is to begin, and may be prescribed for granted permits. Periodic reviews of permitted uses can be conducted. Criminal penalties and injunctive powers shall serve as means of enforcement. (Wheeler-Fla)

FLOWAGE PETITIONS.

Conn Gen Stat Ann secs 52-446 to 52-449 (1960), as amended, (Supp 1968).

Descriptors: *Connecticut, *Mills, *Dams, *Permits, Ditches, Aqueducts, Legislation, Streams, Flow, Flow augmentation, Overflow, Damages, Easements, Obstruction to flow, Streamflow, Relative rights, Legal aspects, Local governments.

Any person who has or desires to set up a water mill upon his land may petition the superior court to improve his water power by the construction of drainage ditches, aqueducts, watercourses, or raceways if such person cannot reach an agreement with the owner of any land affected by such structures as to damages that will be paid. The petition shall contain a description of the land to be overflowed and of the structure (its location, height, and dimensions). The petition shall be heard by a committee of three disinterested property owners of the county who shall determine whether the flowing will be of public use, the structures' dimensions, the length of time during which the structure may be kept up each year, and the damages to be paid. The committee shall report its findings to the court which shall add fifty percent to the damages so assessed. The sum so computed will be paid as compensation for the right to overflow. No structure may be erected to the injury of any lawfully existing mill. Any interested person may object to the committee's report for irregularity or misconduct, but, if accepted, the report shall be final except upon the question of damages. The court may set aside the report for any reasonable cause and make its own inquiry. (Kahle-Fla)

HALE V HULIN (DRAINAGE).
130 So 2d 519-520 (La Ct App 1961).

Descriptors: *Louisiana, *Drainage, *Drains, Drainage practices, Surface drainage, Ditches, Water conveyance, Competing uses, Water law, Judicial decisions, Legal aspects, Surface runoff.
Identifiers: *Servitude of drain.

At issue here was plaintiff's claim to a servitude of drain, which drain consisted of a man-made ditch across a portion of defendant's property. The lower court rendered judgment for plaintiff and the third circuit court of appeals of Louisiana affirmed. The court stated the well-settled Louisiana rule that a drainage ditch is a continuous and apparent servitude and may be acquired by a possession of 10 years and that under applicable case and statutory authority it was clear that defendant's property has become burdened with a servitude of drain in favor of plaintiff's property if it is shown that the ditch has been in existence in excess of 10 years prior to the date suit was filed. The drainage ditch here had clearly been in existence for more than 10 years for which reason the court affirmed the judgment appealed from. (Carruthers-Fla)

SYSTEM OF COUNTY DRAINAGE.

Ga Code Ann secs 23-2501 thru 23-2573 (1966), as amended, (Supp 1968).

Descriptors: *Georgia, *Drainage districts, *Drainage systems, *Water management (Applied), Legislation, Local governments, Drainage, Right-of-way, Easements, Administration, Canals, Dams, Surface waters, Drains, Watercourses, Levees, Land reclamation, Agriculture, Tidal marshes, Legal aspects.
Identifiers: Levee districts, Agricultural lands.

Each county in the state is empowered to establish and maintain a system of lowland drainage. Necessary rights of way and easements may be acquired for that purpose. The clerk of the superior court and the board of commissioners of roads and revenue are to constitute a court having jurisdiction to establish works for the purpose of draining and reclaiming land. The drainage of swamps, the drainage of surface waters from agricultural lands and the reclamation of tidal marshes is considered a public benefit conducive to the public health, convenience, utility and welfare. The procedures to be followed by the court and the board of drainage commissioners are provided. Regulations governing the operation of the exercise of powers by the drainage district are set forth. (Childs-Fla)

MANNING V HALL (MUTUAL DRAINAGE SYSTEM).

110 So 2d 424-428 (Fla DCA 1959).

Descriptors: *Florida, *Drainage systems, *Drainage practices, Ditches, Drains, Reasonable use, Competing uses, Land use, Easements, Surface drainage, Judicial decisions, Arable land, Drainage water.
Identifiers: Injunctions (Permanent), easement by implication, Revocable permissive use, Mutual drain.

On appeal from a final decree granting a permanent injunction allowing plaintiffs the right to maintain a drainage ditch across defendants' lands, the Second District Court of Appeal of Florida held that the injunction was proper and affirmed the decree. The chancellor had reached his conclusion regarding injunctive relief on the basis of a finding of an easement by implication from the circumstances of a sale of land from defendant to plaintiff. The court based its holding on a finding of a mutual drain. Though reciprocal rights in such a mutual drain normally depend upon a finding of mutual contribution of expense and labor in initial construction of a drainage system, the court here held that even though plaintiff contributed no actual expense and labor, the drainage system served the land of both parties, both parties contributed mutually to its upkeep, and plaintiffs' land was dependent upon the system as a substitute for natural drainage. Hence there existed a mutual drainage system with each party having a right to the system's continued operation with such right being enforcible by injunction. (Carruthers-Fla)

MONS V CLAYTON (OBSTRUCTION TO
W OF SURFACE WATERS).

W 2d 501-503 (Ark 1953).

riptors: *Arkansas, *Dams, *Levees, *Ob-
ion to flow, Repulsion (Legal aspects), Sur-
waters, Natural streams, Judicial decisions,
aspects, Surface drainage, Retention, Altera-
f flow, Priorities, Drainage water, Surface ru-

ifiers: Res judicata, Injunctions (Mandatory).

tiff, an owner of higher realty, sought a man-
y injunction compelling a lower owner to
ve a dam which allegedly caused flooding of a
between the tracts. In previous litigation
een the parties, the court had found that
s collected by plaintiff on his land and sub-
ntly flowing over defendant's land were only
ce waters. That determination was res judicata
s case. Thus the dam repelled only surface
and did not block a natural watercourse. The
ction was denied since under Arkansas law a
proprietor may protect himself from surface
by erecting a levee where that is the practical
od of protecting his land from surface water
where in so constructing the levee he acts in
faith and without negligence. (Kahle-Fla)

ural flow, *Obstruction to flow, *Repulsion
l aspects), Surface waters, Drainage water,
, Damages, Easements, Local governments,
ial decisions, Legal aspects, Sewers, Snow
val, Highways, Road construction.

tiffs sued Chippewa County for damages
d when water was unable to flow through a
rt under a federal highway because a county
plow had pushed snow into a county ditch
nting water from flowing into that ditch from
ate ditch on plaintiffs' land. The county had
ructed and agreed to maintain the private
in consideration for granting of an easement.
court held that the county was not liable for
h of contract since the easement agreement
nvalid as being for a private rather than a
c purpose. The county had the same common
ght as an owner of a private property to ob-
and divert the natural flow of surface water
ghway improvement or maintenance and thus
not be liable for negligence. The county, was
able under section 88.38, which provided for
construction and maintenance of drainage
es where highway construction obstructed the
al flow of surface water, since the obstructing
ay was a federal highway. Judgment was
sed, and the cause was remanded with
tions to dismiss. (Kahle-Fla)

OKER V FEIL (OBSTRUCTION TO FLOW
URFACE WATERS).
W 2d 918-920 (Iowa 1949).

Descriptors: *Iowa, *Natural flow doctrine, *Obstruction to flow, *Alteration of flow, Dams, Levees, Surface drainage, Surface waters, Judicial decisions, Legal aspects, Priorities, Damages, Maintenance, Dikes.
Identifiers: Servient land, Injunctions (Mandatory).

Plaintiffs sought damages and an injunction commanding removal of a dike constructed along the division line between two farms which prevented the natural flow of surface water. The court found that defendant's land was subservient to that of plaintiffs' and permanently enjoined the defendant from obstructing the free and complete flow of surface water. Defendant could not maintain the dike at its pre-1939 level on the theory that it had been in existence more than 10 years since a new dike, built in 1939, was a completely different dike, 12 feet south of and higher than the original dike. Plaintiffs were also awarded damages for injury to land caused by interference with the flow of surface water. (Kahle-Fla)
W69-07631

DUENOW V LINDEMAN (OBSTRUCTION TO FLOW OF SURFACE WATERS).

27 NW 2d 421-429 (Minn 1947).

Descriptors: *Minnesota, *Natural flow doctrine, *Obstruction to flow, *Ditches, Drainage, Surface drainage, Surface waters, Judicial decisions, Easements, Prescriptive rights, Natural streams, Tile drainage, Jurisdiction, Relative rights.
Identifiers: Injunctions (Prohibitory), Default judgments.

Plaintiffs sought to enjoin obstruction of a ditch on defendants' land which drained plaintiffs' upper land and to enjoin interference with plaintiffs' removal of the obstruction. Defendants, relying on their attorney's advice, inadvertently defaulted. The trial court found that plaintiffs had a prescriptive right to drain surface water into the ditch and to maintain it at a depth of five feet. On appeal, this court held the judgment void for want of jurisdiction since the question of a prescriptive right was not presented by the complaint and since the relief was in excess of that demanded. The only rights exercisable over the land by the upper and lower owners are rights to have the stream proceed across the land in its natural course. The natural right to drainage is measured according to the course of nature, while the rights under an easement are measured according to the express terms of the grant. Judgment was vacated, and defendants were granted leave to answer. (Kahle-Fla)
W69-07632

IN RE LAKE SEYMOUR (ESTABLISHMENT OF WATER LEVELS).

91 A 2d 813-818 (Vt 1952).

Descriptors: *Vermont, *Water level fluctuations, *Navigable waters, Water measurement, Water policy, Administrative decisions, Water rights, Competing uses, Prior appropriation, Public rights, Drawdown, Dams, Channel improvement, Remedies, Legislation, Lakes.
Identifiers: *Boatable water, Natural maximum level, Natural minimum level, Constitutionality.

This proceeding arose upon exceptions taken by petitioner, to the findings of fact and certificate of the Public Service Commission establishing the natural maximum and minimum levels of a lake. Petitioner owned a dam, located below the lake's outlet and had blasted out a channel that affected the natural maximum and minimum levels of the lake. Petitioner contested the findings of the Public Service Commission as not sustained by the evidence and further urged that the statute authorizing the Commission to establish the levels of the lake was unconstitutional. The court upheld the constitutionality of the statute and affirmed the findings and certificate of the Commission. The court held that since the lake was a body of 'boatable water' within the constitution, the bed of the lake is held by the people of the state in their sovereign capacity in trust for public uses, and the state must preserve the water for the common use of all. No right could be acquired by or be granted to private persons to control the water level of a boatable lake or the outflow therefrom, by artificial means for private purposes. (Carruthers-Fla)

BRIDGES OVER NAVIGABLE WATERS.

33 USCA secs 491-534 (1957).

Descriptors: *Bridges, *Federal government, *Legislation, *Navigable water, Bridge design, Bridge construction, Boats, Navigation, Riparian owners, Alteration of flow, Federal jurisdiction, Federal-state water rights conflicts, Water resources development, Navigable rivers.
Identifiers: Obstruction to navigation, Corps of Engineers.

Any person may construct and maintain a bridge across any navigable waters of the United States. The bridge shall not be built, however, until plans for its construction have been submitted and approved by the Secretary of the Army and the Chief of Engineers. No bridge erected or maintained under the provisions of this chapter shall at any time unreasonably obstruct the free navigation of the waters over which it is constructed. If in the opinion of the Secretary, the bridge unreasonably interferes with navigation, he shall notify the persons owning or controlling such bridges to alter it so as to render navigation possible. Whenever a complaint is made to the Secretary of the Army stating that by the placing of any bridge, piers, or abutment in the navigable waters of the United States, the current has been so deflected as to cause the caving of banks or other serious damage or danger to property, it shall be his duty to make an inquiry, and if necessary require the owners of such bridge to repair the damage. (Smith-Fla)

The Mississippi Supreme Court affirmed on app a chancellor's decree awarding damages and junctive relief against a lower lot owner for di sion of surface waters onto complainant's adjoin higher lot as a result of dirt fill construction by fendant lot owner. Defendant argued before chancellor that the alleged damage to plaint fence and flower beds was not caused by any ac defendant but by floodwaters escaping from small creeks. But the chancellor found that s damage over and above what would have occur had the fill not been on defendant's lot. Thus, of the damage was a result of surface w drainage, rather than floodwater. The court firmed this finding based upon the rule that w adjoining lots owned by different persons are different level, so that there will be a natural flo rainwater from a higher to a lower level, the ow of the lower lot may fend the water therefrom, vided he does so for proper objects and exerc reasonable care to prevent unnecessary injury higher lot. JURISDICTION OF FENCE-VIEWERS.
Me Rev Stat Ann tit 30, secs 3401-3403 (1965).

Descriptors: *Maine, *Wetlands, *Drainage, *Salt marshes, Ditches, Marshes, Swamps, Flooding, Drainage programs, Marsh management, Beaches, Surface drainage, Legislation, Land tenure, Repairing.
Identifiers: *Fence-viewers.

The owners or occupants of salt marsh enclosed by ditches shall maintain such ditches between their own and adjoining enclosures while improving them. Such maintenance shall be in proportion to the benefits accruing to each by such improvements as determined by the fence-viewers in such town. The fence-viewers shall have jurisdiction thereof as they do over fences. Such fence-viewer shall determine the width and depth of the ditch and the time allowed for making it. If a proprietor neglects to make repairs to his portion of the ditch, it may be done by the complainant and 2 or more fence-viewers shall make a certificate of its value. The delinquent owner shall be assessed for expenses. If any person lay his land common, determines not to improve any part of his land adjoining such ditch and gives 6 months notice to all occupants of adjoining lands, he shall not be required to maintain such ditch while his lands be common and unimproved. COMPREHENSIVE HARBOR IMPROVEMENT ACT.

N J Stat Ann secs 40:179-1 to 40:179-77 (1967).

Descriptors: *New Jersey, *Harbors, *Port authorities, *Docks, Piers, Marsh management, Riparian land, State governments, Cities, Legislation, Real property, Construction, Maintenance, Leases, Legal aspects, Financing, Regulation, Navigable waters, Easements, Right-of-way.

This article sets forth a detailed exposition of the power of cities and harbor boards to acquire land for and to construct, maintain, and lease wharves and related industrial terminals and structures in the navigable waters adjacent to such cities. All grants of riparian and underground lands must be negotiated under the auspices of the state riparian commission. Various sections enumerate detailed bond issuing functions and requirements to be followed by the various harbor boards. The article also specifies referendum procedures to be followed under various bonding ventures. (Blunt-Fla)
W69-07671

COMPREHENSIVE HARBOR IMPROVEMENT ACT.
N J Stat Ann secs 40:179-1 to 40:179-11 (1967).

Descriptors: *New Jersey, *Harbors, *Leases, *Riparian land, Docks, Piers, State governments, Cities, Legislation, Real property, Right-of-way, Easements, Compensation, Legal aspects, Safety, Regulation, Navigable waters.

Cities have the right to build and maintain docks or wharves and collect fees for their use by the public provided the city first pays the state reasonable compensation for the riparian grant or lease of the underwater lands. Cities which have acquired leases for public streets terminating in navigable waters previous to the passage of section 40:179-1 need not pay the state additional compensation before wharf construction. The mayor of any city may appoint city harbor boards. If appointed, such harbor boards shall have charge of all waterfront property belonging to the city and of all riparian rights and lands underwater, including easements and rights of way. Harbor boards are empowered to promulgate regulations for the removal of harbor obstructions and to accomplish all other acts required to make the harbors safe for commerce. The harbor boards have the power to lease all city-owned waterfront property and structures under the standards set forth in the section. (Blunt-Fla)

COMPREHENSIVE HARBOR IMPROVEMENT ACT.
N J Stat Ann secs 40:179-12 to 40:179-77 (1967).

Descriptors: *New Jersey, *Riparian land, *Condemnation, *Financing, Local governments, Cities, State governments, Administrative agencies, Regulation, Government finance, Planning, Legal aspects, Construction, Navigable waters.

Harbor boards may recommend that the city government acquire additional upland, riparian land, or underwater land by purchase or condemnation. The boards may recommend that the cities secure additional grants of riparian or underwater lands from the state. The boards shall have the power to issue 'harbor improvement bonds.' This act does not affect the state's rights in any riparian lands or the jurisdiction of the state riparian commission over them. Detailed harbor bond procedures are set forth. Cities may issue bonds for the construction of industrial terminals on water front lands now owned or to be acquired by the cities. Bond issues, referenda requirements, and other fiscal matters are dealt with. Sections 40:179-68 to 40:179-77 deal with the reclamation of marshlands acquired by cities under the general provisions of this harbor improvement act. (Blunt-Fla)

SCHATZ V GUTHRIE (RIGHT TO NAVIGATE A TRIBUTARY).
132 NYS 2d 665-670 (N Y Sup Ct 1954).

Descriptors: *New York, *Navigable waters, *Riparian rights, *Easements, Right-of-way, Streams, Permits, Docks, Remedies, Judicial decisions, Legal aspects, Navigation, Public rights, Access routes, Tributaries, Barriers.
Identifiers: Injunctions (Prohibitory).

Plaintiffs' land lay directly north of a tributary of a navigable stream. Defendants, owners of the bed under the tributary, moved a large barge immediately south of plaintiffs' land so as to interfer with plaintiffs' use of the tributary. Plaintiffs brought this action seeking to restrain interference with their free access to the tributary. The court granted the injunction. It found from the evidence that plaintiffs were upland owners who enjoyed riparian rights and all the easements that flowed therefrom. By positioning their barge as they had, defendants improperly and unlawfully interfered with plaintiffs' right of access and their right to construct landing wharves and piers. The court indicated that the title to land under a navigable stream tributary is subject and subservient to the upland owners right of access to the navigable portion of the stream as well as their right to erect structures to enable them to reach such portion of the stream. The court also found that defendants'

LIBRARY U. OF I., URBANA-CHAMPAIGN

actions had interfered with the public's right to navigate the tributary. (Gabrielson-Fla)

DOIRON V O'BRYAN (MEANING OF RIPARIAN RIGHTS IN A CONVEYANCE).

218 La 1069, 51 So 2d 628-634 (1951).

Descriptors: *Louisiana, *Riparian rights, *Alluvium, *Land tenure, Lake shores, Lake beds, Water law, Judicial decisions, Legal aspects, Dredging, Ownership of beds, Landfills, Rivers, Riparian land, Lakes, Remedies, Land forming, Land development.
Identifiers: *Riparian land conveyances, Jactitation.

Plaintiff brought this action in jactitation against defendant to determine ownership of a parcel of land adjacent to a lake. Because of erosion, for many years this land had been submerged, but due to dredging it became highland. Defendant based his claim on a conveyance from plaintiff by which the deed described the property conveyed as including all lands to the shore of the lake together with all riparian rights belonging to the vendor therein. Plaintiff claimed that defendant was only entitled to the highland existing at the time of conveyance. The court, in holding in favor of defendant found plaintiff entitled to both the highland and the submerged land. The court felt that a conveyance of all land to the shore including riparian rights constituted more than just the riparian use of the water. Such a conveyance included whatever right of ownership, however acquired, the grantor had to the bed of the lake which was covered by water. The court stated that the rights of alluvion and dereliction were not applicable to riparian owners adjacent to a lake, but that plaintiff had acquiesced to defendant's ownership to the property in question. Whenever the flow of water in the Raritan River is less than the rates specified as acceptable at different gauging stations, a sufficient amount of water shall be released from Spruce Run Reservoir to make up the deficiency. The Department of Conservation shall have jurisdiction and control over water made available pursuant to this act. This control includes the power to sell to persons, corporations, and municipalities, after public hearing, and to set reasonable rates. The department shall have power to determine existing water rights in riparian owners, to acquire land necessary for a water supply facility, to receive federal aid for the construction of water supply facilities, to receive other aid or contributions, to adopt regulations for control of facilities, and to enter land to make surveys or examinations. Whenever land is taken by eminent domain proceedings the department may file with the superior court a declaration of taking setting forth a description of the property, the estate or interest being taken, and the sum estimated as just compensation, which sum shall be deposited with the court until a final determination is had. The department shall also have power to make reasonable regulations for the relocation and removal of facilities. The public utility operating the facility before relocation may continue to operate the new facility under the same terms as originally agreed. Any county, municipality, or political subdivision may sell, lease or lend land to the department for a facility. Reservoirs created pursuant to this act may be used for public recreation. AN ACT FOR THE ESTABLISHMENT OF AN INTERIM COMM'N ON THE UPPER MISSISSIPPI RESERVOIRS.
Minn Sess Laws ch 862 (1957).

Descriptors: *Minnesota, *Water resources development, *Reservoirs, *Water pollution control, Water quality control, Water conservation, Rivers, Streams, Legal aspects, Lakes, State governments, Planning, Water policy, Water control, Legislation, Sewage districts, Mississippi River.
Identifiers: Commissions (Interim).

Minnesota created an interim commission for the proper control and regulation of the reservoirs at and near the head waters of the Mississippi River. The commission, consisting of appointed members of the state legislature, was authorized and directed to study the legal factors involved, to recommend legislation found by it to be desirable, and to contact and secure the cooperation of Minnesota members in Congress and federal agencies exercising control. The commission was to report to the governor and to the 1959 session of the Legislature. An interim commission was also created to study the problem of water pollution of state waters, to consider the feasibility of establishing sanitation districts where needed, and to recommend any and all reasonable means of effectively controlling the problems. The commission was to consist of members appointed from the Legislature, and was to report to the Legislature in 1959. (Wheeler-Fla)

Groundwater Management

AL REPORT ON GROUNDWATER IN ONA SPRING 1966 TO SPRING 1967,
ox.
State Land Dept., Water-Resources Rept. No ay, 1968. 44 p, 30 fig, 1 tab.

ptors: *Arizona, *Water consumption, ndwater basins, Arid lands, Aquifer charac-s, Withdrawal, Recharge, Water table, Un-und storage, Water levels, Irrigated land.

2/3 of Arizona's water supply is withdrawn roundwater reservoirs, mainly for irrigation. port includes graphs showing water levels in d wells and estimated annual groundwater ge in most of Arizona. The maps show (1) to water, (2) change in water level, and (3) ial well production. A summary of current lwater programs and publications dealing rizona is presented. Arizona is divided into 3 provinces. The Basin and Range Lowlands ce, of the south, is the best developed turally and is subject to a rapid decline of level. The plateau Uplands province, north, xtensive irrigated crops and suffers no large level decline. Groundwater withdrawal is nd water-level declines are slight in the Cen-ghlands province. Reduced annual ground-pumpage for 1965 and 1966 over previous is attributed to the planting of crops that less water, more precipitation and in-d amounts of surface water runoff. (Sher-Ariz)

GROUNDWATER CONDITIONS IN THE WATERMAN WASH AREA, MARICOPA AND PINAL COUNTIES, ARIZONA,
E. E. Denis.
Arizona State Land Dept, Water-Resources Report, No 37, August, 1968. 23 p, 9 fig, 3 tab.

Descriptors: *Water levels, *Water consumption, *Arizona, Groundwater, Salinity, Fluorides, Sodium, Basins, Aquifer characteristics, Arid lands, Withdrawal, Drawdown, Hydrologic data, Irrigation water, Wells, Pumping, Water quality.
Identifiers: Waterman Wash (Ariz).

This report describes groundwater conditions and water level trends in an arid Arizona basin subjected to year round crop production and recent expansion of cultivated acreage from 3,500 acres in 1952 to 19,000 acres in 1965. Most of the groundwater, in sand and gravel alluvial fill, is under water table conditions. Water level declines for 1961-66 ranged from 20 to 40 ft. Fluoride concentrations in 90% of the samples is high enough to cause rejection for public water supplies. Sodium and salinity hazard is classed as high to very high. Tailwater recirculation practices will slow down, but not stop the depletion at 260,000 acre ft/yr of the 9,240,000 acre ft (1965) supply. (Sherbrooke-Ariz)
W69-07338

THE CHANGING ROLE OF THE GROUNDWATER RESERVOIR IN ARID LANDS,
Bureau of Reclamation, Phoenix, Ariz. Geology Div.
E. E. Komie.
International Conference on Arid Lands in a Changing World, Arizona University, Tucson, June 3-13, 1969. 5 p.

Descriptors: *Groundwater, *Water resources planning, *Arid lands, Groundwater mining, Safe yield, Aquifers, Land subsidence, Overdraft, Underground storage, Competing uses, Water users, Reasonable use, Water conservation, Impaired water quality, Water resources planning, Future planning (Projected).
Identifiers: Western United States.

Groundwater reservoirs have historically sustained much of the growth of agriculture in the Western United States. Uncoordinated groundwater development in the arid areas has resulted in extensive groundwater mining. This overexploitation has caused land subsidence and degradation of water quality. Many present large scale surface water importation projects result from declining water levels in areas where the establishment of agriculture was through the depletion of groundwater storage. Factors influencing the changing role of groundwater reservoirs are: (1) non-agricultural uses increasing faster than agricultural ones, (2) municipal and industrial water requirements displacing the same land areas previously devoted to irrigated agriculture, (3) water that was previously required for agriculture is usually more than ample to provide for this changing use, and (4) this transition of use makes more water available for reuse at localized points and with more convenience than would be associated with return flow from irrigation. These changing conditions require that groundwater reservoirs now must assume diverse functions beyond simple exploitation and become part of a total water resource system. Total water resource system planning, with the use of computer-oriented techniques, will assume new importance in the arid lands of the Western United States. (Sherbrooke-Ariz)

A RECONNAISSANCE OF THE GROUNDWATER GEOLOGY OF MONTVILLE TOWNSHIP, MEDINA COUNTY, OHIO,
Kent State Univ., Ohio. Dept. of Geology.
Raymond E. Zacuzzo.
The Compass of Sigma Gamma Epsilon, Vol 46, No 4, pp 207-216, May 1969. 10 p, 6 fig, 1 tab, 4 ref.

Descriptors: *Aquifers, *Geology, *Water resources, *Ohio, Glacial drift, Shales, Water yield, Wells, River basins, Specific capacity, Drawdown, Salinity, Chlorides, Sediments, Chemical analysis, Statigraphy, Economics, Permeability, Topography.
Identifiers: Medina County (Ohio), Ground-water geology.

Groundwater resources of Montville township, Ohio were investigated on the basis of topographical, geological, and hydrological data. The study shows that near-the-surface rocks consist of glacial deposits and sedimentary bedrock which contains some potable water. The bedrock, mostly consisting of shale, yields from 1 to 50 gpm to small-diameter domestic wells. Higher yields are obtained from the wells located along the walls of the major valley. It is believed that the yields can only be increased slightly by deepening the wells beyond 100-foot depths. Several wells of the township are contaminated with saline water which in places reaches a concentration of 150 ppm of chloride. (Gabriel-USGS)

HYDROLOGIC RESPONSE TO IRRIGATION PUMPING IN HUALAPAI FLAT, WASHOE, PERSHING, AND HUMBOLDT COUNTIES, NEVADA, 1960-67,
Geological Survey, Carson City, Nev.
James R. Harrill, and P. L. Soule.
Nev Water Resources Bull No 37, 1969. 75 p, 10 fig, 1 plate, 21 tab, 32 ref.

Descriptors: *Groundwater, *Water level fluctuations, *Water yield, *Aquifers, *Nevada, Water levels, Transmissivity, Safe yield, Hydrographs, Groundwater basins, Water resources development, Irrigation water, Water quality.
Identifiers: Hualapai Flat (Nev), Washoe County, Pershing County, Humboldt County.

A survey report of the water supply of Hualapai Flat, Nevada describes the groundwater flow system under near natural conditions. Estimated recharge and discharge are on the order of 5,000 acre-ft/yr. Estimated perennial yield is 6,700 acre-ft. All groundwater development is in the northern half of the area. Pumping during the period spring 1960 to spring 1967 has resulted in an estimated storage depletion of 22,000 acre-ft. Net pumpage during the 1967 irrigation season was estimated to be 7,400 acre-ft, which exceeds the estimated perennial yield by about 10%. Pumping is both localized and asymmetrically distributed with respect to natural discharge; consequently, a large quantity of water must be withdrawn from storage before the perennial yield can be salvaged. Before all natural discharge in the valley can be salvaged by pumping, levels at the northern end of the development may decline 150 ft or more. Transmissibility values range from less than 50,000 to more than 100,000 gpd/ft. The long-term storage coefficient for the entire area may average 12 to 13%, but locally may be as high as 20%. Chemical quality of the water in 1967 was generally satisfactory for irrigation, domestic, and stock use, except in the vicinity of the playa. Over the long term, recycling of pumped water and the possibility of migration of poor quality water from beneath the playa could result in a gradual deterioration in water quality in areas of use. GENERAL SYSTEMS APPROACH TO GROUNDWATER PROBLEMS,
Arizona Univ., Tucson.
Lucien Duckstein, and Chester C. Kisiel.
Proc, Nat Symp Anal Water-Resource Syst, pp 100-115, Denver, July 1968. 16 p, 60 ref.

Descriptors: *Systems analysis, *Groundwater, *Optimization, *Decision making, *Water management (Applied), Water policy, Input-output analysis, Leontief models, Regional analysis, Social aspects, Water supply, Surface-groundwater relationships, Constraints.
Identifiers: Descriptive models, Optimizing models.

A survey of the state of the art in groundwater systems analysis, with extensions, was presented. Four levels of groundwater systems problems were discussed: optimal design of devices, intra-basin design and operation, basin-wide policy, and regional community goals. It was stated that the four levels constitute a multilevel optimization problem in that decisions at higher and lower levels influence the optimal decision policy at other levels. Several specialized tools used to study the above levels were described: (a) Direct physical models, both descriptive and optimizing; (b) Input-output analysis, both 'black-box' (e.g. Leontief) and goal seeking systems and (c) the State Variable Approach, both descriptive and optimizing, used by management to observe the behavior of the system as a result of applying an input on a state. Several solved and unsolved problems were discussed. For main entry see W69-07562. (Gysi-Cornell)

CALIFORNIA'S DIGITAL APPROACH TO GROUNDWATER MANAGEMENT STUDIES,
California State Dept. of Water Resources, Los Angeles.
Ernest M. Weber.
Proc, Nat Symp Anal Water Resource Syst, pp 116-120, Denver, July 1968. 5 p.

Descriptors: *Digital computers, *Groundwater, *Water management (Applied), *California, Surface-groundwater relationships, Project planning, Computer models, Analog computers, Storage capacity, Transmissivity, Mathematical models, Simulation analysis, Data collections.

The development, use, acceptance by local agencies, and future needs, of digital computer studies of groundwater management problems in California was discussed. The history of California's early project staging studies, and its initial use of analog computers was given. The development of mathematical models for simulation of the groundwater system on digital computers was outlined. The evolution from the linear models of 1961 to nonlinear models of the present was described. Use of the models to obtain quantitative values for transmissivity and storage was discussed. The cooperative investigations of several local agencies with the State were listed, and the gradual acceptance of digital models over the more educationally and visually oriented analog models was noted. Future needs in the development and collection of data for use in computer simulations were given. For main entry see W69-07562. (Gysi-Cornell)

ON MULTILEVEL OPTIMIZATION IN GROUNDWATER SYSTEMS,
California Univ., Los Angeles.
John A. Dracup, and Yacov Y. Haimes.
Proc, Nat Symp Anal Water-Resource Syst, pp 122-125, Denver, July 1968. 4 p, 14 ref.

Descriptors: *Optimization, *Analytical techniques, *Groundwater basins, Systems analysis, Aquifers, Dynamic programming, Linear programming, Water resources development, Mathematical models.
Identifiers: *Multilevel optimization, *Decomposition, Subsystems.

The use of multilevel optimization techniques for the solution of groundwater system problems was discussed. The concept of multilevel optimization was based on the decomposition of large scale and composed systems and then the reconstruction of the system into independent subsystems. The advantages were: (1) conceptual simplification of complex systems not otherwise solvable, and (2) reduction in dimensionality of the problem. After first level optimization of the subsystems, the subsystems were tied together through coordinator parameters which were responsible for (second level) optimization of the whole system. The application of the above techniques to the California Central Valley Project, where dynamic programming was used for first level optimization and linear programming for the second, was described. Other applications of the technique, such as a two aquifer system identification model and a reverse-osmosis desalination model were briefly described. For main entry see W69-07562. (Gysi-Cornell)

WELLS.

Md Ann Code Art 96A, secs 30-49 (1957), as amended, (Supp 1968).

Descriptors: *Maryland, *Well permits, *Well regulations, *Drilling, Legislation, Water wells, Well casings, Logging (Recording), Well screens, Water yield, Administrative agencies, Aquifers, Groundwater, Legal aspects.
Identifiers: Penalties (Criminal).

Nothing in this title shall be construed to limit the power of any municipality or state agency to adopt regulations not inconsistent with the provisions herein. No well shall be drilled until a permit has been received from the Department of Geology, Mines and Water Resources. The driller shall give such information as the Department may require. Upon completion, a report shall be filed giving the log of each well, size and depth, diameters and lengths of casing and screen, static and pumping levels, yield of the well, and any other information the Department may require. No well driller shall construct a well for any owner who is required to obtain a permit under section 11 of this article until such permit is obtained. Owners of wells shall maintain them in accordance with Department regulations. No owner shall discharge from a well water which is allowed to run to waste. The terms 'well,' 'well driller,' 'owner,' 'person,' 'underground water,' and 'acquifer' are defined. Violations of any provisions of this subtitle are deemed misdemeanors and are punishable by fine of not more than $250 for each such violation. (Kahle-Fla)

ifiers: *Discharge frequency.

long-term sediment movement by natural ns results from flows that occur more ently than once every 10 years. However, is a direct relationship between the variability nual peak discharges and the amount of sedi- moved by less frequent flows. In arid and arid areas, which have the greatest variability nual peak flows, only 40% of the long-term ent load is moved by flows having a frequen- less than 10 yrs. In humid and sub-humid re- where there is much less variability in annual flows, over 90% of the long-term sediment ment is caused by flows that occur more ently than once every 10 yrs. This concept e used when designing sediment control ds in that the most efficient control depends the kind of flows responsible for the largest f the total sediment movement. In arid re- efficient erosion control requires proper gement of the large, infrequent flows; as in humid areas control can best be done by gement of the smaller, more frequent rges. Proper design for sediment control in natural streams must take into account not only the sediment volume involved, but also the characteristics of the hydraulic forces causing movement. (Knapp-USGS)

MISCELLANEOUS STATUTES (WATERSHED MANAGEMENT).

Minn Sess Laws ch 644 (1957).

Descriptors: *Minnesota, *Wildlife conservation, *Wildlife management, *Water conservation, Legislation, Drainage, Flood control, Watershed management, Lakes, Ponds, Marshes, Wetlands, Hunting, State governments, Land management, Administrative agencies, Local governments.

The commissioner is authorized to acquire wildlife lands in the name of the state. The lands subject to acquisition include marsh or wetlands and their margins, including ponds, small lakes and stream bottoms, which he finds desirable for the interests of water conservation as related to wildlife development. Purchases must be approved by the Board of County Commissioners in the county where the land is located. Soil conservation district supervisors are to counsel the Board as to the best utilization of the land to be purchased and on questions of drainage and flood control. The Commissioner in the purchase of such wetlands must not interfere with or delay drainage proceedings instituted by landowners in watershed areas when such proceedings are conducted according to the Minnesota Drainage Code. Funds for carrying out this act are to be provided by a one dollar surcharge on hunting licenses. Payments to counties in lieu of taxes on lands so acquired shall be paid from these funds. (Kahle-Fla)

SOIL CONSERVATION DISTRICTS TO PREVENT EROSION.
W Va Code Ann secs 19-21A-2, 19-21A-5, 19-21A-8, 19-21A-13C (1966).

Descriptors: *West Virginia, *Erosion control, *Soil conservation, *Flood control, Land use, Legislation, Crop production, Cities, Flood protection, Dikes, Storm runoff, Water supply, Bodies of water, Sedimentation, Projects, Navigation, Fish food organisms, Permeability, Soil stabilization, Recreation, Topsoil, Porosity, Soil surfaces, Drainage water, Public health.

It has been recognized by the legislature that improper land use practices have caused serious soil erosion. The preservation of farm land is essential to the health, safety, and welfare of the public. Soil erosion has caused the accumulation of silt and sedimentation in streams, reservoirs, and other bodies of water. By removing valuable topsoil, erosive forces have sharply decreased the productivity of land. In addition, the loss of the absorptive topsoil has perpetuated conditions conducive to flooding. The accumulation of silt and sediments on lake and river beds has destroyed the flood supply of fish and has interfered with navigation. To combat erosion, soil conservation districts shall be established. Any twenty-five persons owning land lying within the territorial limits of a proposed district may petition the state soil conservation committee to organize a district. Once organized, the district has power to investigate and to take preventive or improvement measures. The district shall also have numerous other comprehensive powers to allow it to deal effectively with this serious problem. Cities and counties are authorized to contract with a district for construction of flood control projects and to use the projects as recreational areas. (Stewart-Fla)
W69-07609

CONDEMNATION BY COUNTIES FOR WATERSHEDS.
Ga Code Ann secs 36-1401 through 36-1405 (Supp 1968).

Descriptors: *Georgia, *Eminent domain, *Watershed management, *Flood control, Legislation, Condemnation, Local governments, Watersheds (Basins), Small watersheds, Flood protection, Easements, Recreation facilities, Legal aspects.
Identifiers: Improvement works, Watershed projects.

In order to create small watershed projects and to provide for flood control, each county is authorized to exercise the power of eminent domain. This power is exercisable for the purpose of creating recreational facilities developed in connection with any watershed project. In addition, the power of eminent domain may be used to acquire ways of ingress and egress to any such project. The procedures to be followed in condemning land for the enumerated purposes are to conform with those provided by existing eminent domain statutes. (Childs-Fla)

SOIL CONSERVATION.

Minn Stat Ann secs 40.01-40.03 (1963).

Descriptors: *Minnesota, *Soil conservation, *Soil erosion, Legislation, State governments, Federal government, Floods, Diseases, Droughts, Administration, Administrative agencies, Standards, Legal aspects.

It is the declared public policy of the state to prevent soil erosion, floods, water shortages, disease, and general suffering resulting therefrom. In line with this policy a soil and water conservation commission is established, consisting of nine members, five of whom must be operating farmers. The commission shall have the powers and duties to assist and supervise soil conservation districts, to coordinate the programs of the several districts, to secure the cooperation of the federal government, to disseminate soil conservation information, and to subdivide or consolidate conservation districts. Provisions are set out for the establishment of soil conservation districts by petition of landowners. (Kahle-Fla)

WATERSHED IMPROVEMENT DISTRICTS.
W Va Code Ann secs 19-21B-1 through 19-21B-13 (1966).

Descriptors: *West Virginia, *Watershed management, *Watersheds (Basins), Water users, Soil conservation, Legislation, Public health, Public benefits, Local governments, State governments, Water resources, Water resources development, Water utilization.
Identifiers: Soil conservation districts, Watershed improvement district.

Landowners within a soil conservation district may petition the supervisors of the district for the establishment of a watershed improvement district. Requirements for the petition are set out. The supervisors shall hold a public hearing and establish a watershed improvement district whenever conservation, development or utilization of water will be promoted by the construction of improvements and where there is a need in the interest of public health, safety or welfare for the organization of such a district. When established the district constitutes a governmental division of the state and a public body corporate with all the powers of the soil conservation district in which it is situated. The supervisors of the soil conservation district shall be the governing body of the watershed improvement district and may appoint three landowners in the district as trustees to carry out the business of the watershed improvement district. The district may be discontinued after five years by petition made in same manner as was necessary for its creation. (Kahle-Fla)

5B. Sources of Pollution

PROBLEMS OF POLLUTION OF IRRIGATION WATERS IN ARID REGIONS,
Utah State Univ., Logan. Dept. of Agricultural and Irrigation Engineering; and Federal Water Pollution Control Administration, Ada, Okla.
H. B. Peterson, A. A. Bishop, J. P. Law, and Robert S. Kerr.
International Conference on Arid Lands in a Changing World, Arizona University, Tucson, June 3-13, 1969. 21 p, 3 fig, 27 ref.

Descriptors: *Water quality, *Water pollution sources, *Return flow, *Irrigation effects, Arid lands, Sediments, Saline water, Drainage effects, Consumptive use, Reuse, Disposal, Runways, Fertilizers, Pesticide residues, Impaired water quality, Radioactive wastes, DDT, Animal wastes (Wildlife), Dissolved solids, Heavy metals, Industrial wastes, Farm wastes, Municipal wastes, Nematodes, Nitrates, Organic wastes, Phosphates, Pollutants.

Sources and types of water pollution, both natural and man related, and their relation to irrigation agriculture in afferent and efferent roles are discussed. Sources of natural pollution described are salts, sediments, animal wastes, plant nutrients, and toxic elements. Sources of agricultural pollution detailed are concentration of salts under irrigation, plant nutrients from fertilizers (nitrogen and phosphorus), wastes from animal-feeding operations and pesticides (directly and as break-down compounds). Pollutants of industrial waste of particular concern to irrigated agriculture include total dissolved solids, sodium, chlorides, boron, heavy metals, pesticides, radio-activity and numerous organics. Water quality needs of irrigated agriculture are briefly considered and probable changes in quality as a result of irrigation are detailed. Several methods to regulate pollutants in return flow are presented, as are ways of reducing the salt loading effect of waters. Several possible benefits of irrigation treatment of water are listed. ORGANIC PRODUCTION IN A TROPICAL ESTUARY,
National Inst. of Oceanography, Cochin (India). Biological Oceanographic Div.
S. Z. Qasim, S. Wellershaus, P. M. A. Bhattathiri, and S. A. H. Abidi.
Proc Indian Acad Sci, Vol 69, No 2, Sect B, pp 51-94, Feb 1969. 44 p, 11 fig, 8 tab, 69 ref.

Descriptors: *Organic matter, *Productivity, *Tropical regions, *Estuarine environment, Carbon, Radioisotopes, Photosynthesis, Water temperature, Seasonal, Pollutant identification, Pollutants, Chlorophyll, Nutrients, Zooplankton.
Identifiers: *India, Cochin backwater estuary, Organic production, Tropical estuary.

Daily and seasonal rates of primary production in tropical estuaries and their critical appraisal were investigated on the basis of observations recorded at four stations located in the upper reaches of the Cochin Backwater estuary, and several earlier publications. The article contains the following sections: (1) introduction; (2) procedure and methods; (3) the environment; (4) rate of photosynthesis; (5) incubation time and diurnal rhythm; (6) photosynthesis as a function of illumination; (7) gross and net production; (8) seasonal changes in production rates; (9) factors influencing organic production; (10) estimation of production from radiation and chlorophyll; (11) productivity in relation to particular matter; (12) annual production; (13) efficiency; and (14) productivity in relation to zooplankton. The study shows that in a highly turbid and polluted estuary the C-14 assimilation is nearer to net production and the diurnal rhythm in photosynthesis is associated with the increase and decrease in daily illumination. Seasonal changes in the production rates are not well marked and show only 3- to 4-fold increase in certain months. The study also shows that for most of the year, primary production seemed nonexistent at depths greater than about 4 m and temperature and nutrients are not limiting factors in the estuary. OXYGEN DYNAMICS AND ECONO GROWTH IN THE MILLSTONE RIVER,
Rutgers - The State Univ., New Brunswick, N. J.
William Whipple, Jr., and M. Marcus.
American Society of Mechanical Engineers PID-8. Presented at ASME-AIChE Joint C ference on Stream Pollution and Abatement, J 10-12, 1969. 9 p, 8 fig, 5 tab.

Descriptors: *Organic loading, *Water pollu source, *Biochemical oxygen demand, Oxygen Economics, Economic prediction, Water pollu effects, Stream pollution, Water quality.
Identifiers: *Oxygen dynamics, *Unrecorded ganic loading, Unrecorded pollution, BOD conc tration, BOD loading.

The Millstone River is a small stream used water supply purposes in a rapidly urbanizing of Northern New Jersey. A study of its organic lution and biochemical oxygen demand was m in order to correlate the gross man-made w load with growth of population and of industr the area. This study has been successful in estim ing the organic loading of the river and its princ tributaries, over an eleven year period, and in c puting how much of a pollution load must h been placed in the water in various areas in orde account for the pollution remaining downstrea was shown that gross pollution load, inclu recorded waste loads removed by waste treatm plants increased more than proportionately either population growth or manufacturing activ The most astonishing finding was that the orga loading due to recorded treatment plants efflu was only about half of the apparently man-made ganic loading from other sources. This finding very serious implications from the viewpoint water pollution control program depending so upon treatment of recorded effluents. (Whipp Rutgers)

sources, Water pollution effects, Water
stry, Environmental effects, *Pollutant
fication, Bioassay, *Chemical wastes, Pesti-
esidues.
fiers: Watauga River, Boone Reservoir.

g the 5-day period July 9 through 13, 1968,
than 500,000 fish were killed in the Watauga
f Boone Reservoir in northeast Tennessee.
ish were killed by a toxic compound of
al mercury that leaked out of a 55-gallon
drum. Many such drums are used for flotation
ses at boat docks, and many have become
cts. The cause of the kill was difficult to track
and it was not until all the more common
s of fish-kill were eliminated that a toxic
ial and its source were pinpointed. Con-
ble scientific detective work was necessary to
the toxicant, and much laboratory and field
was involved. Several laboratories and agen-
cooperated in the investigation. The report
nents the procedures followed in establishing
use of the fish-kill. (Ingram-TVA)

paper reports on a study of acid generation
the tailings pond system and effluent receiv-
ream of a base metal mine located in the
eastern part of New Brunswick, Canada. The
under investigation contains a sulphide ore
and the effluent from the mine is discharged
South Little River. The study shows that the
anism of acid generation is due to the follow-
l) the formation and subsequent precipitation
icium carbonate; (2) the chemical oxidation
rtially oxidized sulphur compounds; and (3)
the precipitation of sulphite. Within the receiving stream the generation of acid is caused by the continuing chemical oxidation of sulphur compounds and, predominantly, by the bacteriological utilization of the thionates to produce sulphuric acid. Some possible treatment of wastes is also given. (Gabriel-USGS)

POLLUTION FORECASTING IN AN ESTUARY (JAPANESE),
Tokyo Univ. (Japan). Dept. of Urban and Sanitary Engineering.
Akinori Sugiki.
J Fac Eng, Tokyo Univ, Ser A, Annu Rep No 6, pp 12-13, 1968. 2 p, 5 fig, 2 ref.

Descriptors: *Pollutant identification, *Pollutants, *Estuaries, Estuarine environment, Oxygen, Oxygenation, Mathematical studies, Mixing, Aeration, Bottom sediments, Nitrogen compounds, Sulfur compounds.
Identifiers: Estuary pollution.

This study was undertaken for the purpose of elucidating the mechanism of estuary pollution, using the Sumida estuary as an example and analyzing the factors affecting the oxygen balance of polluted waters. The study shows that a mixing theory developed for the Thames river estuary is the most reliable for forecasting the conditions of pollution in a strongly mixed estuary. The study also gives a clear understanding of deoxygenation, reaeration and oxygen consumption by bottom deposits, and other estuary parameters in the process of estuary pollution. The 1975 and 1985 pollutional loads of the sumida estuary were estimated and presented in this investigation. (Gabriel-USGS)

WASTE WATER RECHARGE AND DISPERSION IN POROUS MEDIA,
Massachusetts Inst. of Tech., Cambridge. Dept. of Civil Engineering.
John Austin Hoopes, and Donald R. F. Harleman.
Mass Inst Tech Hydrodynamics Lab Rep No 75, June 1965. 166 p, 40 fig, 3 tab, 120 ref. PHS Grant No WP-347.

Descriptors: *Path of pollutants, *Groundwater movement, *Diffusion, *Dispersion, *Mathematical models, Model studies, Hydraulic models, Tracers, Injection wells, Artificial recharge, Convection, Mixing, Flow, Porous media.
Identifiers: Disposal wells.

The effects of dispersion and diffusion of wastewater solutes in aquifers near the injection wells are incorporated in a mass conservation equation. Solutions are derived to predict the tracer distributions resulting from various recharge and disposal operations. For uniform flow, the longitudinal and lateral dispersion coefficients are related to the seepage velocity, particle size, and media structure. These coefficients are determined from experimental measurements of the distribution of a dilute salt tracer in flow through a sand column. Convection and dispersion determine the tracer distribution near the well. At larger distances from the well, molecular diffusion and convection alone are important. With a pair of wells, one recharging tracer fluid and the other pumping the mixture of tracer and native groundwater, the solution for the tracer distribution indicates that lateral dispersion has a negligible influence on the tracer distribution, except very near the line joining the two wells. Molecular diffusion is also shown to be insignificant, except for small flow rates and large well-spacings. Longitudinal dispersion determines the shape of the tracer distribution within the media, whereas convection dominates the tracer distribution at the pumping well, except for short times. EUTROPHICATION STUDIES IN A SHALLOW INLET ON VANCOUVER ISLAND,
Fisheries Research Board, Nanaimo (British Columbia). Biological Station.
Michael Waldichuk.
J Water Pollut Contr Federation, Vol 41, No 5, Part 1, pp 745-764, May 1969. 15 fig, 2 tab, 14 ref.

Descriptors: *Eutrophication, *Estuaries, *Nutrients, Municipal wastes, Industrial wastes, Salinity, Water temperature, Water pollution, Water pollution effects, Dissolved oxygen, Phosphates, Nitrates, Ecology.
Identifiers: *Canada, Vancouver Island, Juan de Fuca Strait.

Thirteen sampling stations were established in the Victoria Harbor, B. C., Canada, area to establish the gradient of temperature, salinity, dissolved oxygen, pH, phosphate, nitrate, ammonia, soluble carbon, and chlorophyll from the relatively uncontaminated Juan de Fuca Strait to the heavily polluted Portage Inlet and tributary waters. While the input of nutrients into the inlet is not large, the volume of the system is so small and flushing so poor that nutrients become concentrated, particularly during the summer months when phosphates and nitrates are absorbed by the plankton and deposited on the bottom. From all practical points of view, there is little solution to this enrichment problem short of removal of all nutrient sources. The plan envisaged by the Provincial Government to cut a canal through the Thetis Cove to Portage Inlet, and by a system of locks to provide a means of rapidly flushing the system, seems to be a good solution to the eutrophication problem. However, the ecology will be modified considerably and the temperature in Portage Inlet during the summer months will be much reduced, making it less suitable for bathing. (Knapp-USGS)
W69-07361

POTENTIAL POLLUTIONAL EFFECTS IN DEEP LAKES,
Environmental Control Administration, Cincinnati, Ohio.
Henning Eklund.
J Water Pollut Contr Federation, Vol 41, No 5, Part 2, pp R155-R159, May 1969. 5 p, 3 fig, 9 ref.

Descriptors: *Lakes, *Thermal stratification, Dissolved oxygen, Water pollution, Nutrients, Biochemical oxygen demand, Epilimnion, Hypolimnion, Thermocline, Water temperature, Turnovers, Water circulation.
Identifiers: Deep lakes.

The annual circulation of deep lakes is not as simple as that for shallow lakes. The hypolimnion of a deep lake may contain an inherent stability independent of the stability associated with a thermocline. It appears that deep lakes do not necessarily turn over every year. If this is true and the dissolved oxygen in the hypolimnion becomes depleted it might be several years before the oxygen would be replenished through complete overturn of the lake. Directly contributed biochemical-oxygen-demanding material, plankton that develop from nutrient buildup, and biochemical-oxygen-de-

LIBRARY U. OF L. URBANA-CHAMPAIGN

manding material released by anaerobic decomposition conceivably cause this oxygen depletion which might last for an extended period. (Knapp-USGS)

THE ROLE OF ALGAE IN THE BIOLOGICAL TREATMENT OF WATER (FRENCH),
IRCHA (France). Microbiology Service.
R. Cabridenc, and H. Lepailleur.
Terres and Eaux, Rev Int de L'Hydraul, Vol 22, No 58, pp 12-18, Jan-Mar 1969. 7 p, 7 fig, 1 tab, 25 ref.

Descriptors: *Algae, *Biological treatment, *Water treatment, *Pollutant identification, *Pollutant abatement, Effluents, Streamflow, Desalination, Tertiary treatment, Lagoons, Oxygenation, Absorption, Ecology, Water purification, Carbon, Bicarbonates, Photosynthesis, Nutrients, Microbiology.
Identifiers: Water purification by algae.

The role of algae, as a desalination and purification agent, was investigated on the basis of earlier publications and recent experiments conducted by the authors. The study shows that oxygen liberated in the course of photosynthesis leads to the oxygenation of aquatic media and considerable reduction of pathogenic germs. The study also shows that there is competition between algae and other microorganisms; however, in the present state of knowledge, the problem of interaction due to the production by algae of inhibiting or activating substances is still not clearly understood. The degree of purification of water by the lagooning process, in many cases is equivalent to, or greater than that obtained by other biological processes. (Gabriel-USGS)

THE ACTINOMYCETES,
Rutgers - The State Univ., New Brunswick, N. J. Inst. of Microbiology.
Hubert Lechevalier.
Proc Rudolfs Res Conf, Rutgers Univ, New Brunswick, NJ. Principles and Applications in Aquatic Microbiology, Heukelekian, H and Dondero, Norman C (eds), John Wiley and Sons, Inc, New York, pp 230-253, 1964. 10 fig, 1 tab, 43 ref, disc.

Descriptors: *Classification, *Actinomycetes, Bacteria, Fungi, Microorganisms, Spores, Viruses, Antibiotics (Pesticides), Anaerobic conditions, Cultures, Isolation, Sampling, Oxygen, Soil microorganisms, Mud, Temperature, Saline water, Electron microscopy, Bacteriophage, Hydrogen sulfide, Rubber, Foods, Biodegradation, Farm wastes.
Identifiers: Actinophages, Gram-positive bacteria, Lysozyme, Media, Chemical composition, Morphology, Cellular size, Sporangia, Hyphae, Mycelium, Chemical content, Bright field microscopy, Cell wall, Actinomycoses, Contaminants, Nuclear membrane, Termites, Pericarditis, Leprosy, Pneumonia, Nocardiosis, Farcy, Tumefactions, Potato scab, Wool, Leather, Diaminopimelic acid isomer.

Actinomycetes produce most antibiotics. Electron microscopic observations established them taxononically as bacteria. Cellular size, cellular contents, and absence of membrane around the nuclear material show striking relationships. Actinomycetes are hosts to phages of their own that are similar to bacteriophages both in action and in morphology. They are sensitive to strictly antibacterial antibiotics and resistant to strictly antifungal antibiotics. The mucoid nature of their cell walls is similar to certain Gram-positive bacteria. Enzymatic studies clearly differentiate the walls of actinomycetes from those of fungi. There are strictly anaerobic forms among actinomycetes and bacteria but not among fungi. Isolation of pure cultures was best made on lean media not favorable to true bacteria. A morphological distinction depends upon the growth of spores on aerial or substrate mycelium. Since actinomycetes are bacteria with fungal morphology, methods of morphological studies are those of fungi. The key to the genera is morphologic, but the chemical composition of the cell walls is also a deciding factor. Natural distribution of the ten genera is wide. Soil is their greatest reservoir. They are salt-tolerant and found in marine microflora. Fish pick up from them and store a substance with undesirable tastes and odors. For main entry see W69-07423. (Jones-Wisc)

ARTHROBACTER,
Agricultural Univ., Wageningen (Netherlands). Lab. of Microbiology.
E. G. Mulder.
Proc Rudolfs Res Conf, Rutgers Univ, New Brunswick, NJ. Principles and Applications in Aquatic Microbiology, Heukelekian, H and Dondero, Norman C (eds), John Wiley and Sons, New York, pp 254-279, 1964. 28 fig, 5 tab, 37 ref, disc.

Descriptors: *Classification, *Microorganisms, *Fermentation, *Water purification, *Microbiology, *Aerobic bacteria, Sludge, Plant growth, Industries, Acidicity, Temperature, Chemical properties, Carbohydrates, Nitrogen compounds, Vitamins, Yeasts, Mycobacterium, Amino acids, Degradation (Decomposition), Cellulose, Herbicides, Lignins, Phenolds, Desiccants.
Identifiers: *Morphology, *Physiology, *Pleomorphism, *Decompose, Cheese, Cystites, Biotin, Cellulomonas biazotea, Microbacterium, Brevibacterium linens, Corynebacteriaceae, Nocardia, Polysaccharides, Micrococcus.

Microorganisms of the Arthrobacter type are important in soil, water, and industrial microbiology. In coccoid state, they are part of autochthonous flora and in rod form, of zymogenous flora. Habitat includes activated sludge, certain cheese, and plants. Certain strains attack compounds which normally are not attacked by microorganisms; some produce compounds which have commercial value. In the coccus stage resistant to prolonged desiccation even beyond 10 months, soil arthrobacters synthesize polysaccharides; excrete amino acids; give active phage suspension; and decompose cellulose, lignin, phenols and certain herbicides. Strains from activated sludge strongly decompose carbohydrates. The various Arthrobacter strains are morphologically similar but physiologically different. Isolation and identification depends on chemistry of media, temperature, and acidity. Nutrients and age affect morphology. Aerobic, pleomorphic characteristics are evident. Diverse Arthrobacter strains are morphologically similar to Brevibacterium linens, Cellulomonas biazotea, and Mycobacterium phlei. Gram-negative or Gram-variable in rod stage in soil, arthrobacters shifted to Gram-variable in coccoid form; reverse was also found. Strains from activated sludge, except those with phenol-decomposing capacity, reacted like soil strains. Utilization of nitrogen compounds and vitamin requirements affect classification. Arthrobacter from soil and sludge can utilize inorganic nitrogen either without vitamins or with biotin. For main entry see W69-07423. (Jones-Wisc)

gical processes of some microorganisms, ially bacteria, cause transformation of al matter. Involved are direct enzymic in-ion--oxidations and reductions, hydrolysis, te destruction--and, indirect nonenzymic in-ion--insoluble matter corrosion by metaboli-produced acid, inorganic ions precipitation by metabolically-produced inorganic ions, ad-on onto cell surfaces, and metal chelate for-n. The bacterial chemosynthetic autotrophs ineral oxidation as a chemical energy source, ing power for the synthesis of organic matter carbon dioxide and water. Oxidation of metal es and of Fe (II) to Fe (III) takes place. Bac-photosynthetic autotrophs use mineral oxida-nerely as a source of reducing power in car-lioxide assimilation, depending on radiation energy. The enzyme, inorganic hosphatase, present in bacteria, is probably lyzed to orthophosphate. Pyrophosphate can lex Mn (III) and hydrolysis could lead to the precipitation. Enzymic breakdown of the ing agent by bacteria may result in precipitat-e metal ions. The nonenzymic interactions d on end products of metabolism, acids act on acid-soluble minerals. Some itations may form amorphous or crystalline nerates. In adsorption, iron and manganese s possibly form into encrustations. In chela-a metabolically produced organic compound complex one or another metal ion. For main see W69-07423. (Jones-Wisc)

E OBSERVATIONS OF THE SPHAEROTI-EPTOTHRIX GROUP,
s Univ., Urbana. Lab. of Microbiology.
Mulder.
Rudolfs Res Conf, Rutgers Univ, New Brun-, NJ. Principles and Applications in Aquatic biology, Heukelekian, H and Dondero, Nor-C (eds), John Wiley and Sons, New York, pp 2, 1964. 21 fig, 6 ref, disc.

iptors: *Classification, *Bacteria, Microor-n, Enzymes, Oxidation, Iron, Manganese, res, Nitrogen compounds, Carbon, Vitamins, es, Soil water, Sewage bacteria, Waste water tion), Activated sludge, Habitats.

Identifiers: *Chlamydobacteria, *Morphology, *Physiology, Media, Poly-beta-hydroxybutric acid, Sphaerotilus natans, Leptothrix ochracea, Leptothrix lopholea, Leptothrix pseudo-ochracea n sp, Leptothrix cholodnii n sp, Leptothrix discophora, Sheaths.

Morphological and physiological characters of strains of Sphaerotilus-Leptothrix bacteria were studied in slowly-running sterile soil extract containing ferrous iron, on agar media, and in cultures with or without manganese salts. The effect of nitrogenous and carbon compounds and of vitamins was tested. Isolated from activated sludge, waste water, and running ditch water containing iron precipitates, all members of the group can be grown in synthetic media containing glucose, aspartic or glutamic acids, and vitamin B-12. All oxidize manganous salts, except Type I. Their cells contain globules of poly-beta-hydroxybutic acid. Type I, Sphaerotilus natans, with long sheaths, differs from Leptothrix ochracea. Nutrients affect presence of sheaths and smoothness of colony edges. Types II and III have large cells resembling S natans, but differ in utilization of organic nutrients. Type II, Leptothrix lopholea, forms fungus-like flocks of short trichomes, radiating from a common holdfast in liquid media. Type III, Leptothrix pseudo-ochracea n sp, resembles Leptothrix ochracea with shorter and frequently empty sheaths. Type IV, Leptothrix cholodnii n sp, forms filamentous colonies, large, white and smooth, or black-brown, dependent on the media. Type V, Leptothrix discophora, has smaller cells than Type IV, smaller colonies than the other types, and are filamentous or smooth. For main entry see W69-07423. (Jones-Wisc)

RIVER BACTERIOLOGY AND THE ROLE OF BACTERIA IN SELF-PURIFICATION OF RIVERS,
Eidgenoessische Anstalt fuer Wasserversorgung, Abwasserreinigung und Gewaesserschutz, Zurich (Switzerland).
Karl Wuhrmann.
Proc Rudolfs Res Conf, Rutgers Univ, New Brunswick, NJ. Principles and Applications in Aquatic Microbiology, Heukelekian, H and Dondero, Norman C (eds), John Wiley and Sons, New York, pp 167-192, 1964. 5 fig, 2 tab, 7 ref, disc.

Descriptors: *Bacteria, *Rivers, *Self-purification, *Currents (Water), Ecology, Pollutants, Recreation, Water supply, Oxygen, Habitats, Biomass, Soil microbiology, Fungi, Flow, Velocity, Temperature, Plants, Groundwater, Sewage, Mosses, Diatoms, Phenols, Biochemical oxygen demand, Ammonium compounds, Nitrogen compounds, Alkalinity, Degradation (Decomposition), Metabolism, Hydrography, Oxygen sag, Chemical analysis, Rates, Parametric hydrology.
Identifiers: Glucose, Sphaerotilus natans, Beggiatoa, Biotopes, River Nile, Soil water, Fontinalis, Amblystegium, Hormidium, Thiobacillus, Leptothrix, Fusarium, Leptomitus lacteus, Hydrocarbons, Zoogloea, Carchesium polyp, Vorticella sp, Synedra ulna, Nitzschia palea, Zurich, Elimination, Autotrophs, Heterotrophs, Time.

Water current is important synecologically but has no autoecological significance to bacteria in rivers. In two experimental rivers, with waters of different quality, the proportion of the freely suspended bacteria was less than 1% that of the epiphytic. A third large group of bacteria, the epibenthic, is especially numerous in polluted streams. Majority of bacteria in rivers are introduced by washings from soil or with sewage. The hygienic types are not important ecologically. Unique mass developments of certain bacteria or fungi observed in streams have no parallel in soil microbiology. It is doubtful whether flow velocity exerts direct physiological influence essential for growth. Self-purification, defined as removal of organic compounds from water by the metabolism of microorganisms, is estimated quantitatively on the results of recognized analytical procedures for individual chemical compounds, or, for a known group of compounds. Biochemical oxygen demand values do not fulfill this requirement. Model rivers controlling ecological factors were assayed. Self-purification rate is highly dependent on absolute quantity of biomass in intimate contact with flowing water. The simultaneous quantitative and qualitative estimate of acting microorganisms and qualitative measure of self-purification of defined chemical compounds are significant. For main entry see W69-07423. (Jones-Wisc)
W69-07431

THE ECOLOGICAL ROLE OF PHOSPHORUS IN WATERS WITH SPECIAL REFERENCE TO MICROORGANISMS,
Dalhousie Univ., Halifax, Nova Scotia. Dept. of Biology.
John E. Phillips.
Proc Rudolfs Res Conf, Rutgers Univ, New Brunswick, NJ. Principles and Applications in Aquatic Microbiology, Heukelekian, H and Dondero, Norman C (eds), John Wiley and Sons, New York, pp 61-81, 1964. 13 fig, 14 ref, disc.

Descriptors: *Phosphorus, *Phosphorus radioisotopes, *Ecology, *Water, *Microorganisms, *Bacteria, Phytoplankton, Zooplankton, Plants, Sediments, Mud-water interfaces, Radioactivity, Cores, Invertebrates, Sea water, Phosphorus compounds, Lakes, Chromatography, Mud, Temperature, Light, Density.
Identifiers: Antibiotics, Terramycin, Tetracycline, Eriocaulon, Sphagnum, Utricularia, Gammarus locusta (Marine), Halifax (NS), Nostoc, Fucus vesiculosus, Scanner.

Phosphorus level may limit the productivity of lakes and oceans. Microorganisms are important in the continual exchange of phosphorus between the water phase, the sediments, higher plants, and zooplankton. Water bacteria reduce the rate of exchange and hold more phosphorus in the water. Normal competition for phosphorus exists between the various solid phases. Rapid uptake of radiophosphorus by Gammarus in the presence of bacteria shows that higher invertebrates obtain their food by digestion of particulate matter rather than by direct absorption of dissolved inorganic or organic compounds, thus microorganisms play an essential role in making phosphorus available to zooplankton and hence to higher groups in the food chain. Conversion of dissolved inorgnic phosphate to dissolved organic phosphorus through the intermediate activity of bacteria is a reversible process. There is no direct reconversion of dissolved organic phosphorus to inorganic phosphate without intermediate incorporation into the bacteria. Preliminary integration of time relationship of the several phosphorus reactions which might occur in a lake or bay is warranted. On adding phosphate to water, the immediate reaction is the transfer through the bodies of unicellular suspended life forms. Time depends on temperature, light, cell density and nutrient availability. For main entry see W69-07423. (Jones-Wisc)

GROWTH CHARACTERISTICS OF ALGAE IN RELATION TO THE PROBLEMS OF MASS CULTURE,
Carnegie Institution of Washington, Stanford, Calif. Dept. of Plant Biology.
Jack Myers.
Extracted from ALGAL CULTURE: FROM LABORATORY TO PILOT PLANT, John S Burlew, Editor. Carnegie Institution of Washington Publication 600, Washington, DC. 4 fig, 2 tab.

Descriptors: *Growth rates, *Algae, Photosynthesis, Eutrophication, Light, Temperature, Carbon dioxide, Nutrients, Biological properties, Water pollution effects.
Identifiers: *Mass culture, *Algal growth, Chlorella pyrenoidosa (Emerson strain), Autoinhibitors.

Biological significance of the conditions affecting algal growth is discussed with special reference to Chlorella pyrenoidosa (Emerson strain). Consideration is given to the effect of controlled and measurable conditions, and these results are extrapolated to describe the characteristics of high-density cultures. The effect of light as a limiting factor is discussed also. In particular, growth rates are described as functions of (1) temperature, (2) light intensity, (3) concentration of carbon dioxide, (4) components of the nutrient medium, (5) autoinhibitors, and (6) characteristics of the organism. A specific growth rate of 1.96 per day is considered to be about the maximum rate for C pyrenoidosa and it is concluded that this value is not established by limitations of photosynthesis. ON THE QUESTION OF THE EFFECT OF GROWTH DURING THE FIRST YEARS OF A FISH'S LIFE ON ITS SUBSEQUENT GROWTH,
D. F. Zamakhaev.
Trans from Tr Vses Nauch Issled Inst Morsk Rybn Khoz i Okeanogr Vol 50, pp 109-141, 1964. Fisheries Research Board of Canada Translation Series No 549, pp 1-39, 1965. 10 fig, 11 tab, 85 ref.

Descriptors: *Growth rates, *Fish, Age, Fish populations, Herrings.
Identifiers: *Lee's phenomenon, *Early growth, *Growth compensation, Caspian shad, Russia, Russian literature, Russian fisheries research, Zander.

Growth during the first year of fishes life has a strong influence on growth during subsequent years. Subsequent years growth is positively correlated with first-year growth, although the effect diminishes with the increasing age of the fish. In many species of fish, rapid first-year growth leads to earlier maturity, and, apparently, earlier physiological senility. An extensive review of the Russian literature regarding the relations between Lee's phenomenon, growth compens and first-year growth is given; Western litera (through 1957) is also reviewed. Tabular graphical data on observed and calculated gr are primarily from Russian sources. (Voigtla Wisc)

THE EFFECT OF INORGANIC SEDIMENT STREAM BIOTA,
DePauw Univ., Greencastle, Ind.
James R. Gammon.
Progress Report 1968. 84 p, 18 fig, 30 tab, 22 r

Descriptors: Industrial wastes, Qua Limestone, Sediments, Sediment yield, *Wate lution effects, Stream pollution, *Standing *Sedimentation rates, Benthic fauna, Density, population, Indiana, Pollution abatement.
Identifiers: Stonedust pollution, Diversity ind Population density, Macroinvertebrates.

Large quantities of sediment are carried to oc annually, complicating water treatment, redu recreation values of water and shortening reser life. Massive amounts of sediment also seri damages aquatic life, but quantitative studies lacking. Populations of fish in pools and mac vertebrates in riffles of a small stream were stu in relation to a crushed-rock quarry. In 1967 33,600 kg of stonedust entered the stream fro quarry, while in 1968 due to altered quarry o tions more than 4.8 million kg were produced standing crop of fish in two pools above the q averaged 400 kg/ha. The average standing crop pools below the quarry rose from only 200 kg/ June to 250 in August 1967 because of the ent numerous, small redhorse and longear sunfish creased amounts of suspended sediment red this to only 100 kg/ha in June 1968 and by tember, 2 pools were filled with sediment and tained no fish. Comparable changes were not the density of macroinvertebrate popula which nevertheless exhibited comparable div indices both above and below the quarry. Fe ganisms were tolerant to the sediment and a were notably intolerant, especially carpsucker gizzard shad.

MANAGEMENT OF WASTE HEAT FR THERMAL POWERPLANTS,
Tennessee Valley Authority, Chattanooga. P Research Staff.
C. J. Powell, and C. H. Waugaman.
Paper at American Public Power Association gineering and Operations Workshop, Feb. 1 1969, Robert Meyer Hotel, Jacksonville, Fla.

Descriptors: Thermal pollution, *Water poll control, Temperature control, *Tennessee V Authority Project, Powerplants, Water temp ture, Zooplankton, Aquatic organisms, Aq life, *Fish conservation, Pollution abate Aquatic plants.
Identifiers: *Waste heat management, *Water perature standards.

Water temperature standards being adopted u the Water Pollution Control Act constitute a constraint in the design and operation of st electric generating plants. The TVA has condu at its Paradise Plant in Kentucky five research jects to determine the effects of increased w temperature on aquatic organisms; it is proje continued research at its Browns Ferry Nu

At Paradise the criterion was reduced to 90
average temperature and a maximum surface
:rature of 93 deg F. The principal means of
:al control of thermal discharges employed
kimmer walls, submerged dams, diffusers,
flow regulation, reduction of generation, and
ıg towers. (Mills-TVA)

ria for outfall designs were established based
e copper concentration in the effluent from a
ing plant, its concentration after dispersion in
nvironment and the ecological effects of heat,
y and copper on the planktonic organisms in
ater column. The copper introduced into the
from existing distillation plants averaged
0.34 to 0.65 mg/l. Copper was found to be
soluble in sea water concentrates than in sea
, with a minimum solubility at pH 7.5. The
val of copper from brine blowdown by plating
uminum was found to be technically unfeasi-
ue to side reactions involving evolution of
gen. The removal of of copper on Dowex A-1
ing resin was found to be an efficient process,
ie estimated cost would be 4.2 cents/1000 gal-
or a 1.5 MGD plant. The use of diffusers to
ie effluent with sea water to reach safe copper
ntration by dilution is believed to be a more
ical solution than chemical removal or inac-
on. (Gransee Office of Saline Water)

OSAL OF THE EFFLUENTS FROM
ALINATION PLANTS INTO ESTUARINE
ERS,
Chemical Co., Freeport, Tex.
Zeitoun, E. F. Mandelli, and W. F.
lenny.
Office of Saline Water, Research and Development Progress Report No. 415, March 1969. 140 p. OSW-14-01-0001-1161.

Descriptors: *Brine disposal, *Brines, Estuaries, *Saline water, *Thermal pollution, Waste disposal, Effluents, Desalination.
Identifiers: *Marine ecology, *Biological effects, Hydrology.

Trends in the development of saline water conversion systems are reviewed. Effluent quantities and characteristics produced by the plants of various sizes and types are evaluated. The hydraulics of the estuary are described and related to the size and type of desalination plant. Biological effects of waste brines on the estuarine resources are discussed. The disposal of effluents from desalination plants into estuarine waters can produce changes in the temperature, salinity, copper concentration, oxygen content, hardness and other minor parameters of the environment. The proper design of an outfall system will minimize environmental changes. Pretreatments that may be found necessary before introduction of the effluent into the receiving estuary are aeration to increase its content of dissolved oxygen or copper removal. EUTROPHICATION--A REVIEW,
Wisconsin Univ., Madison. Water Resources Center.
Kenton M. Stewart, and Gerard A. Rohlich.
Water Quality Control Board, California, Pub No 34, 188 pp, 1967. 4 fig, 611 ref.

Descriptors: *Bibliographies, *Eutrophication, *Reviews, *Water pollution control, *Water pollution effects, *Water pollution sources, Translations, Algicides, Bacteria, Benthos, Bioassay, Chlorophyll, Fertilization, Fish, Harvesting, Hydraulics, Lakes, Limnology, Nutrients, Optical properties, Oxygen, Plankton, Productivity, Radioisotopes, Radioactive dating, Sedimentation, Systematics, Silting, Thermal properties, Vegetation, Water chemistry, Water quality.
Identifiers: Asia, Australia, Case histories, Europe, Laboratory studies, North America, Residence time.

This retrospective critical review of eutrophication considers some 314 documents which are, authors imply, key references bearing on the problem. In addition to study of the diverse literature, they discussed subject with investigators at home and abroad, and the resulting discussions are incorporated into corpus of review. Incorporating material on botany, zoology, limnology, agricultural engineering and areas related to eutrophication, the organization of the report is indicated by its section headings: Introduction; definitions of eutrophication, production, productivity, and blooms; trophic typology of lakes; physical considerations including climate, morphometry, thermal properties, optical properties, hydromechanics, residence time, siltation and sedimentation; nutrient considerations including field and laboratory studies; biological considerations including taxonomy, plankton, fish and bacteria; fertilization studies including examples and research techniques; a variety of case histories, both domestic and foreign; a variety of indices for measuring eutrophication; natural and developmental origin of nutrients and their quantities; desirable and undesirable effects of eutrophication; current methods for prevention and control including land use, effluent diversion, dredging, roughfish harvest, plant harvest, low-flow augmentation, algicides, and nutrient removal from waste waters; and research needs. Report includes a second bibliography to augment literature cited, and appendices of serial titles, conversion factors, and glossary. (Eichhorn-Wisc)

EFFECTS OF HEATED DISCHARGE UPON AQUATIC RESOURCES OF WHITE RIVER AT PETERSBURG,
Indiana Univ., Bloomington. Dept. of Life Sciences.
Max A. Proffitt.
Ind Univ Water Resources Res Center Rep of Invest No 3, Feb 1969. 101 p, 9 fig, 4 plate, 21 tab, 10 ref.

Descriptors: *Thermal pollution, *Heated water, *Thermal powerplants, *Indiana, Water temperature, Biology, Dissolved oxygen, Water chemistry, Water quality, Water pollution effects.
Identifiers: White River (Ind), Petersburg (Ind).

A field study was made of the physical, chemical and biological effects of heated water discharges on the White River at Petersburg, Indiana. The discharge water is about 18-20 deg F warmer than the ambient water temperature and is at times as much as 1/4 of the total river flow. Mixing is complete within 1 mile, and the mixed water temperature is never over 5 deg F warmer than upstream temperatures. The average warming is about 1/2 deg F. Oxygen is not depressed significantly. Negative effects on life are confined to the effluent canal, and some fishes and invertebrates are more abundant in the heated water. The highest recorded river temperature was 107 1/2 deg F. (Knapp-USGS)

FACTORS INITIATING PHYTOPLANKTON BLOOMS AND RESULTING EFFECTS ON DISSOLVED OXYGEN IN DUWAMISH RIVER ESTUARY, SEATTLE, WASHINGTON,
Geological Survey, Washington, D. C.
Eugene Welch.
Geol Surv Water-Supply Pap 1873-A, 1969. 62 p, 22 fig, 5 tab, 45 ref.

Descriptors: *Phytoplankton, *Eutrophication, *Washington, *Estuaries, Aquatic productivity, Nutrients, Oxygen, Plankton, Biochemical oxygen demand, Water circulation, Hydraulics, Currents (Water), Tides.
Identifiers: *Phytoplankton blooms, *Seattle (Wash), Duwamish River.

Phytoplankton productivity, standing stock, and related environmental factors were studied during 1964-66 in the Duwamish River estuary, at Seattle, Wash., to ascertain the factors that affect phytoplankton growth in the estuary. Phytoplankton blooms, primarily of diatoms, occurred in the lower estuary during August 1965 and 1966. No bloom occurred during 1964, but the presence of oxygen-supersaturated surface water in August 1963 indicates that a bloom did occur then. Nutrients probably were not the primary factor controlling the timing of phytoplankton blooms. The consistent coincidence of blooms with minimum fresh-water discharge and tidal exchange during August throughout the study period indicates that bloom timing probably was controlled mostly by hydrographic factors that determine retention time and stability of the surface-water layer. This control was demonstrated in part by a highly significant correlation of gross productivity with retention time and stability of the surface-water layer. This control was demonstrated in part by a highly significant correlation of gross productivity with retention time (as indicated by fresh-water discharge) and vertical stability (as indicated by the difference between mean surface and mean bottom temperatures). The highly significant correlation of chlorophyll (a) with BOD throughout the summer indicates that respiration and decomposition of phytoplankton cells is clearly an important contributor of BOD. A green algal population in vitro did increase in response to added effluents nutrients; however, the available field data suggest that a 46% increase in effluent discharge between 1965 and 1966 did not increase the estuary's phytoplankton biomass significantly. PREDICTING DISSOLVED OXYGEN VARIATIONS CAUSED BY ALGAE,
Federal Water Pollution Control Administration, Alameda, Calif. Central Pacific River Basins Project.
Richard C. Bain, Jr.
ASCE Proc, J Sanit Eng Div, Vol 94, No SA5, Pap 6155, pp 867-881, Oct 1968. 15 p, 8 fig, 2 tab, 26 ref, append.

Descriptors: *Dissolved oxygen, *Algae, *Respiration, *Estuaries, *Eutrophication, *California, Water pollution, Reaeration, Nutrients, Oxygen sag, Aeration, Biochemical oxygen demand, Photosynthetic oxygen.
Identifiers: Streeter-Phelps equation, Dissolved oxygen variations, San Joaquin River, Potomac estuary, San Francisco Bay.

Eutrophic environments are often dominated by planktonic algal populations (phytoplankton) which cause diurnal variations in DO concentrations through respiratory activity and photosynthesis. Photosynthetic oxygenation and respiratory deoxygenation rates of estuarine phytoplankton were measured at various standing crop (chlorophyll) levels. Oxygen production and consumption rates for actively growing phytoplankton populations were related to standing crop at 20 deg C and non-limiting light. Variations in algal photosynthetic production rate, as related to light adaption, age of cells, nutrition, temperature and algal type, are considered. The Streeter-Phelps equation was modified to include phytoplankton production and respiration rates in formulations designed to predict DO concentrations over a 24-hr period. An example is given, and the resulting predictions are compared with field measurements from a tidal reach of the San Joaquin River, California. (Knapp-USGS)

CITY OF COLUMBIA V LENTZ (OVERFLOW OF MUNICIPAL SEWAGE SYSTEM).

282 SW 2d 787-793 (Tenn Ct App 1955).

Descriptors: *Tennessee, *Sewage disposal, *Water pollution sources, *Municipal wastes, Pipelines, Cities, Water pollution effects, Impaired water quality, Manholes, Pollutants, Sewage effluents, Legal aspects, Judicial decisions, Damages, Overflow.
Identifiers: Nuisance (Private), Evidence.

Plaintiffs brought this action to recover damages for an alleged nuisance caused by discharge of raw sewage from manholes along defendant city's sewer pipeline onto plaintiffs' farmland and into a creek. Plaintiffs' evidence showed that defendant's sewer line periodically overflowed onto their field and into a creek, permitting raw sewerage to accumulate which gave off foul and noxious odors, polluted the water in the creek, impaired the value of their farm, and rendered plaintiffs' home almost uninhabitable. The court of appeals held that the evidence was sufficient to support the nuisance allegation and the amount of damages recovered. The court noted that such accumulation of effluents and filth constituted actionable nuisance at common law and under the Tennessee statute. It also held that deeds conveying the right of way for the sewer did not give the city the right to overflow sewage through the manholes upon plaintiffs' land, and hence constituted no defense to the action. WATER SUPPLY AND WATER RECLAMATION FOR NEW DALLAS-FORT WORTH REGIONAL AIRPORT,
Tippetts-Abbett-McCarthy-Stratton, New York.
Edward A. Bryant, and John F. Lenard.
J Water Pollut Contr Federation, Vol 41, No 5, Part 1, pp 772-784, May 1969. 13 p, 5 fig, 8 tab, 10 ref.

Descriptors: *Water reuse, *Airports, Industrial wastes, Water supply, Activated sludge, Lagoons, Sewage treatment, Irrigation water, Waste water disposal.
Identifiers: Dallas (Tex), Fort Worth (Tex).

Engineers have the opportunity at the New Dallas-Fort Worth Regional Airport to recommend a water and wastewater design which is not compromised by existing facilities. After a preliminary study of 13 representative airports, it was decided to provide an average water demand (1975) of 5 mgd (18,900 cu m/day) for the facility--equivalent to a city of 50,000 people. Because of the lack of nearby receiving waters, reuse of wastewaters is planned. The diversity of the waste (from the cleaning of planes and parts, and from domestic, restaurant, and other miscellaneous operations) and the recirculation uses (air-conditioning make-up, irrigation) makes the design problem involved. A special industrial wastes pretreatment scheme for oil separation and neutralization followed by activated sludge and lagooning is planned. (Knapp-USGS)

A MATHEMATICAL MODEL FOR THE CONTINUOUS CULTURE OF MICROORGANISMS UTILIZING INHIBITORY SUBSTRATES,
Clemson Univ., S.C. Environmental Systems Engineering.
John F. Andrews.
Biotechnology and Bioengineering, Vol X, Issue 6, pp 707-723, 1968. 10 fig, 12 ref.

Descriptors: *Mathematical models, *Microorganisms, *Kinetics, Growth rates, Cultures, Biological treatment, Waste treatment, Eutrophication, Water pollution effects.
Identifiers: *Continuous culture, *Inhibitory substrates, Growth kinetics, Batch cultures, Growth inhibition, Substrate-limited growth.

A mathematical model is presented describing the kinetics for both batch and continuous culture of microorganisms utilizing substances which limit growth at low concentrations and inhibit growth at higher concentrations. A key feature of the model is the use of an inhibition function (after Haldane) which relates substrate concentration to specific growth rate. A digital computer was used in simulation studies and it is shown that the primary result of inhibition by substrate in a batch culture is an increase in the lag time, whereas in continuous culture process instability may result. The model is also used to illustrate how process failure may occur during start-up of continuous-flow biological processes as a result of inhibition. The model should be of value in investigations of the stability of biological processes used for the treatment of certain industrial wastes which are known to be inhibitory to many of the organisms metabolizing them. '. Water Treatment and Quality Alteration

VELOPMENT OF METHODS FOR CONOLLING THE COPPER CONTENT IN ATER,
ode Island Univ., Kingston. Water Resources ater.
Kenneth H. Mairs.
Completion Report OWRR Project A-014-RI, 1968. 10 p.

Descriptors: *Corrosion control, *Inhibition, *Copper, *Limestone.
Identifiers: *Mineralization, *Soft water, *Well water.

This project had two major objectives: (1) to study the means by which copper becomes soluble in water and (2) to devise means or methods by which soluble copper could be controlled or reduced to acceptable limits. The overall reaction for corrosion of copper in mildly acid solution has been demonstrated to be: 2 Cuz 2Hzz 1/2 02x 2 Cuzz H2O. In order for this reaction to proceed, the water must be acidic and contain oxygen. This condition is found in many soft, natural waters. To limit the copper content, one must either destroy the aggressiveness or remove the copper as the water is used. Obviously the first approach is more desirable. A neutralizing filter proved to be a simple effective inexpensive control device. Basically, this filter is a deep bed of limestone chips which reacts with and reduces the free carbon dioxide content of raw water. While corrosion and soluble copper is effectively controlled, the bicarbonate hardness and pH are increased appreciable. (Rose-Rhode Island Univ)

OPTIMUM DESIGN OF WATER FILTRATION PLANTS,
Iowa State Univ., Ames. Engineering Research Inst.
E. Robert Baumann.
Proc, Nat Symp Anal Wat r-Resource Syst, pp 195-217, Denver, July 1-3, 1968. 25 p, 8 fig, 8 tab, 14 ref.

Descriptors: *Hydraulic design, *Filtration, *Optimization, *Mathematical models, Timing, Correlation analysis, Digital computers, Water supply, Economic efficiency, Design, Head loss, Water quality, Water treatment.
Identifiers: *Diatomite filters, Gilter cakes.

A 'Program for Optimization of Plant Operation', (POPO) was described for the design of diatomite filtration plants for operation at least cost. Mathematical models were developed to predict head-loss time relationships for a diatomite filter under varying operating conditions. Filter cake resistance coefficients were collected and correlated to measurable filtration variables. Through the use of a computer program the cost combinations of filtration designs were specified. It was found that the POPO has potential in the determination of least cost combinations of water filtration design and operating parameters. The size of the plant was found to have significant effects on the minimum cost. Optimum filtration rate increased with plant size. For main entry see W69-07562. (Thiuri-Cornell)

RAW-WATER QUALITY CRITERIA FOR PUBLIC SUPPLIES,
Robert J. Becker, Elwood L. Bean, Byron Beattie, H. H. Budd, and Richard L. Woodward.
Journal of American Water Works Association, Vol 61, No 3, pp 133-138, Mar 1969. 6 p, 10 ref, 2 tab.

Descriptors: *Water quality, *Standards, *Water quality control, *Supply, Water, Color, Color reactions, Odor, Water temperature, Turbidity, Coliforms, Alkalinity, Ammonia, Inorganic compounds, Metals, Boron, Salts, Dissolved oxygen, Fluorides, Hardness (Water), Nitrites, Nitrates, Hydrogen ion concentration, Phosphorus, Dissolved solids, Pesticides.

Criteria for the concentration of various substances which affect raw-water quality are set forth. The criteria are set for considered treatment processes which were thought most commonly used nationwide: coagulation, sedimentation, sand filtration and disinfection with chlorine. The report discusses, in limited detail, the subcommittee's findings as to desirable criteria relating to eighteen classifications of substances. There are two levels of criteria. Permissible criteria are those characteristics and concentrations of substances in raw water which will permit the production of acceptable public water after treatment by one or more of the methods set forth above. Desirable criteria are those characteristics and concentrations of substances which represent high-quality water in all respects. The criteria set forth in the report are to be used with substantial discretion because of the great regional variations in raw water quality. (Blunt-Fla)

WATER POLLUTION CONTROL.
W Va Code Ann sec 20-5A-17 through 20-5A-24 (1966), as amended, (Supp 1968).

Descriptors: *West Virginia, *Water pollution control, *Administrative agencies, *Abatement, Legislation, Regulation, Water pollution, Water pollution sources, Permits, Local governments, Jurisdiction, Water pollution effects, Fishkill, Aquatic life, Natural resources.
Identifiers: *Criminal law, Injunctions (Mandatory), Injunctions (Prohibitory).

The chief of the division of water resources may apply to the circuit court for the abatement of any water pollution which he deems a nuisance. Application shall be made to the circuit court of the county where the alleged water pollution is occurring. In cases of aggravated pollution where irreparable harm will result from any delay, the chief may apply for an immediate temporary injunction. Any person who fails to discharge any duty imposed on him by law or order of the chief is guilty of a misdemeanor. If such failure to obey any duty causes loss of game-fish or aquatic life, the state department of natural resources shall bring action to recover a sum equal to the cost of replacement. There is no criminal liability for a violation caused by an act of God, war, riot, or catastrophe which is not caused by negligence or wilful misconduct. If any provision of this article is invalid, such invalidity shall not affect the other provisions of the article. (Stewart-Fla)

The Maryland Department of Water Resources has the duty to study and recommend means of pollution abatement, and the Department may encourage voluntary cooperation among competing

LIBRARY U. OF I., URBANA-CHAMPAIGN

interests. The Department may enforce and assist other agencies in enforcing existing pollution laws. It shall also be authorized to conduct research and develop additional information on pollution. The Department may receive complaints, conduct hearings upon proper notice, and issue orders directing persons causing pollution to secure specified results; if such results are not secured, the person may be directed to install proper and practicable treatment facilities. The Department may also review and make recommendations to other state agencies which may be causing pollution. In addition, the agency may establish reasonable water quality standards. The Department has the right of entry upon any property, and the duty to periodically review appropriation permits. Criminal penalties and injunctions are available to the agency to insure compliance with the act's provisions. Specific enforcement provisions have been made applicable to oil discharge. (Wheeler-Fla)

NEW ENGLAND INTERSTATE WATER POLLUTION CONTROL COMMISSION.

Conn Gen Stat Ann sec 25-67, 25-68 (1958), as amended, (Supp 1968).

Descriptors: *Connecticut, *New England Interstate WPS Compact, *Water pollution control, *Pollution abatement, Interstate compacts, Interstate commissions, Legislation, Water law, Maine, Massachusetts, New Hampshire, Rhode Island, Vermont, Interstate rivers, Planning, Financing.
Identifiers: *Interstate waters, Water classification.

The New England Interstate Water Pollution Control Commission is composed of the Commissioner of Health, the Director of the Water Resources Commission, and the governors of three signatory states. The purpose of the pollution control compact between Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island and Vermont is to abate the pollution of interstate waters. The compact provisions apply to all waters contiguous to two or more signatory states. There are to be 5 commissioners from each state and a majority of the 5 must approve any action obligatory upon the state. THhe commission may recommend legislative action to carry out the purpose of the compact, but it may not pledge the credit of any signatory state. The commission will impose no single standard of water quality; however, each state is called upon to submit classifications of use for their interstate waters from which the commission will recommend standards for water classification. Each state agrees to abate and control pollution consistent with the classified use of each body of water. Costs of administration are to be proportionately borne by the signatory states. The commission may enter into agreements with New York concerning pollution abatement. (Holt-Fla)

WATER POLLUTION CONTROL.

Conn Gen Stat Ann 25-54a through 25-54aa (Supp 1968).

Descriptors: *Connecticut, *Water pollution control, *Administrative agencies, *State governments, Streams, Water resources development, Water conservation, Water supply, Water utilization, Condemnation, Eminent domain, Water harvesting, Subsurface waters, Surface waters, Public benefits, Public health, Public rights, Wastes, Pollution abatement, Legal aspects, Potable water, Water quality, Water users, Hydraulic structures, Legislation.

Water pollution is recognized by statute to be inimical to public health. The Water Resources Commission was created to prevent future pollution and to abate existing pollution of a thermal or chemical nature. The Commission is charged with development of comprehensive anti-pollution programs. The Commission is to require submission of plans and specifications for the construction or modification of pollution abatement facilities. Standards of water quality applicable to the various waters of the state shall be adopted by the Commission in order to further public welfare and to conserve wildlife. These standards shall be consistent with those established by the Board of Health and shall not be adopted in final form without undergoing the scrutiny of a public hearing. The Commission may order any municipality to cease and desist from polluting public waters. After 1 May 1967, a permit shall be required before any person may discharge water or material into state waters. Persons discharging substances into state waters prior to this date may substantially change the volume or flow thereof. The Commission may make a grant to any municipality which constructs or rebuilds a pollution abatement facility. (Katz-Fla)

WATER POLLUTION CONTROL.
Conn Gen Stat Ann sec 25-54a to 25-54d (Supp 1968).

Descriptors: *Connecticut, *Administrative agencies, *State governments, Legislation, Streams, Water resources development, Water conservation, Water supply, Water utilization, Condemnation, Eminent domain, Water harvesting, Subsurface waters, Surface waters, Public benefits, Public health, Public rights, Wastes, Water pollution control, Pollution abatement, Legal aspects, Potable water, Water quality, Water users, Hydraulic structures, Sewage disposal, Project planning, Permits, Administrative decisions.

The Water Resources Commission is charged with the general supervision and administration of this statute. The Commission shall develop comprehensive programs for the prevention, control and abatement of existing pollution of state waters. The responsibility for coordination of water policy objectives between local, state and federal agencies rests with the Commission. Studies, investigations and demonstrations concerning water pollution shall be conducted by the Commission. The Commission may issue, modify or revoke orders regarding the abatement of water pollution. All plans and specifications for modification or construction of disposal systems or pollution abatement systems must be submitted to the Commission. Upon approval of such plans, a permit will be issued authorizing the proponent to proceed. The Commission is granted the power to exercise all incidental powers necessary to carry out the purposes of this provision. (Katz-Fla)

NKS V TOWN OF BURNSVILLE (SUIT TO OIN CITY FROM EMPTYING SEWAGE O STREAM).

N C 553, 46 SE 2d 559-561 (1948).

criptors: *North Carolina, *Potable water, unicipal wastes, *Water pollution, Pollution tement, Public health, Sewage, Waste disposal, er supply, Cities, Streams, Riparian land, Judi- decisions, Legal aspects.
ntifiers: Demurrer.

ntiffs brought suit to enjoin defendant mu- pality from emptying sewage into a slow ning stream. Following a showing that defen- t was in fact disposing of sewage into the am, the trial court granted the injunction. On eal, the trial court was reversed. The appellate rt noted that plaintiffs did not allege that they ed land abutting upon or contiguous to this am, nor that the stream was used as a source for lic drinking water. Defendant's demurrer uld have been sustained. The court held that, re public drinking water is concerned, mu- pal activities may be enjoined at the insistence ny person. However, if no public drinking water ply is involved, the individual seeking relief t allege that he owns land adjacent to such am and that the acts complained of are such as constitute a nuisance causing irreparable age to him. Failure to allege the above men- ed elements was fatal to plaintiffs' cause. gan-Fla)

ntifiers: Injunctions (Prohibitory).

ntiff brought this suit to enjoin operation and ing of gas and oil wells within an area surround- a lake. The lake constituted the plaintiff city's er supply. The city passed an ordinance declar- the lake area to be a drainage basin and hibiting drilling or operation of oil wells. The ndants alleged that this was an unlawful taking roperty without due process of law. The court l that the city had statutory power to enact this nance and that the statute was not unconstitu- al. The police power to protect public water ply against pollution may be delegated to cities. plaintiff city's ordinance was held to be a valid rcise of the police power, and the injunctive re- against oil well pollution was deemed proper. court further held that when it was apparent pollution would follow drilling operations, in- ctive relief could be granted before defendants n started operations. GRADATION OF GAMMA-BHC IN SIMU- TED LAKE IMPOUNDMENTS AS AF- CTED BY AERATION,

consin Univ., Madison. Dept. of Soils.
Leo W. Newland, Gordon Chesters, and Gerhard B. Lee.
J Water Pollut Contr Federation, Vol 41, No 5, Part 2, pp R174-R188, May 1969. 15 p, 7 fig, 1 tab, 28 ref. OWRR Grant No B-016-WIS.

Descriptors: *Insecticides, *Biodegradation, *Lakes, Model studies, Anaerobic conditions, Anaerobic bacteria, Aerobic conditions, Aerobic bacteria, Dissolved oxygen, Gas chromatography.
Identifiers: Benzene hexachloride, Insecticide detoxification.

The degradation of gamma-BHC (a benzene hexachloride isomer) in simulated aerobic and anerobic lake impoundments was determined. Anerobic degradation was much more rapid than aerobic degradation. In the aerobic simulated lake impoundment, degradation of 15 percent of the added gamma-BHC occurred in 2,100 hr and the isomer alpha-BHC was formed as the degradation product. In the anerobic impoundment 90% of the added gamma-BHC was degraded in the 2,100 hr incubation period to the isomers alpha and delta-BHC. Because of the profound effect of oxygen on degradation rates and the apparent 'lag phase' of the reaction, it is concluded that the isomerization of gamma-BHC occurs by a biological mechanism. The isomerization leads to detoxification of the insecticide.

MINE WASTEWATER PROBLEMS IN EUROPE,

Pennsylvania Dept. of Mines and Mineral Industry, Harrisburg. Div. of Research and Development.
David R. Maneval.
Proc 22nd Ind Waste Conf, May 2-4, 1967, Part 2, Purdue Univ, pp 608-619, 1967. 12 p, 9 fig.

Descriptors: *Acid mine water, *Water pollution control, Waste water treatment, Injection wells, Drainage, Groundwater, Aquifers, Filtration, Industrial wastes, Municipal wastes, Sewage treatment.
Identifiers: *European mine-water practices.

The cooperative approach of managing the water resources and water quality of a watershed which seems to be gathering strength in the United Kingdom, the Netherlands, Belgium, and Germany has many economic advantages. In most of the countries there is extensive research going on in connection with water pollution problems associated with the coal industry. In some countries, some aspects of this research are far advanced over that in the United States. European experience, particularly in England, clearly indicates that well-coordinated research efforts in the mine drainage and preparation plant effluent field by personnel permanently assigned to such research is of great benefit to the industry and to water pollution efforts. Most of the countries are ahead of the United States in the abatement of pollution from coal-processing plants. Usually, requirements in Europe regarding the discharge of solids from such plants are more stringent than they are in Pennsylvania. More effort should be put forth to review the European literature in this field and to provide for a more continuing exchange of technical information between European and American experts. The joint treatment of domestic and industrial wastes, observed in Europe, is of considerable economic benefit. Efforts in this direction should be expanded as much as possible. (Knapp-USGS)
W69-07418

THE CONTROL OF ACID MINE DRAINAGE POLLUTION BY BIOCHEMICAL OXIDATION AND LIMESTONE NEUTRALIZATION TREATMENT,

National Coal Board, Rotherham (England). Div. of Mine Water Investigation.
H. Gordon Glover.
Proc 22nd Ind Waste Conf, May 2-4, 1967, Part 2, Purdue Univ, pp 823-847, 1967. 25 p, 11 fig, 3 tab, 59 ref.

Descriptors: *Acid mine water, *Water pollution control, *Biodegradation, Waste water treatment, Iron bacteria, Sulfur bacteria, Neutralization, Limestone, Sulfates, Iron, Acid bacteria, Acid streams.
Identifiers: Acid mine drainage treatment.

A new process for the purification of acid drainage from coal mining operations is described. Novel features include the biochemical oxidation of ferrous salts in acid solution and the application of mechanical attrition to limestone grit which is used for the chemical neutralization of the oxidized drainage. The new process will be most applicable to the more dilute acid drainages for which the conventional lime process is less suitable, and the costs of the new process, where applicable, are expected to be appreciably less than the costs of the lime process. (Knapp-USGS)

REAERATION MEASUREMENTS IN A EUTROPHIC STREAM,

Pennsylvania State Univ., University Park. Dept. of Civil Engineering.
W. A. Glain, and A. J. McDonnell.
Proc 22nd Ind Waste Conf, May 2-4, 1967, Part 2, Purdue Univ, pp 1044-1058, 1967. 15 p, 7 fig, 5 tab, 13 ref, 2 append.

Descriptors: *Reaeration, *Water pollution, *Streamflow, Turbulence, Slopes, Velocity, Channel morphology, Biodegradation, Oxygen sag, Dissolved oxygen, Oxygenation, Waste assimilative capacity.
Identifiers: Reaeration of eutrophic streams.

Reaeration was studied in a eutrophic stream in Pennsylvania, and observations were compared with predictions made by standard methods. In most cases, predictions by the methods of Owens were too high, while those by Churchill's formula were too low. For the study reaches investigated, corrections to reaeration coefficients reduced estimates as much as 40%. For steam bed slope, velocity, and depth ranges of 1.7 to 4.5 ft/1000 ft, 0.3 to 1.1 fps, and 0.90 to 1.8 ft; respectively, the empirical equation of Churchill best defined observed variability but the isotropic turbulence formula of O'Connor and Dobbins most accurately predicted observed reaeration coefficients. ECONOMICS OF INDUCED RIVER AERATION,

Rutgers - The State Univ., New Brunswick, N. J.
William Whipple, Jr.
ASME/AIChE Stream Pollution Abatement Conference June 12, 1969. 21 p, 4 fig, 2 tab, 9 ref.

Descriptors: *Water quality control, *Aeration, *Dissolved oxygen, *Reaeration, Organic loading, Water pollution, Biochemical oxygen demand, Oxygen sag, Economics, Water pollution effects, Stream pollution, Water quality, Oxygenation.
Identifiers: *Artificial river aeration, *Induced river aeration, Unrecorded pollution, Unrecorded organic loading, BOD concentration, BOD loading.

A demonstration grant and several research programs related to possibilities of adding to the dissolved oxygen of streams by artificial means, or induced river aeration, has been underway for several years. This paper summarizes the general conclusions and certain economic considerations, and will be followed by a more detailed report. It is shown that for small polluted rivers induced river

UNIV. OF ILL. URBANA-CHAMPAIGN

aeration is an entirely practicable alternative to advanced waste treatment and is apt to be much less expensive. The procedures for measuring oxygen transfer rate in tanks and lagoons are not generally applicable to rivers. On rivers such as the Passaic River, the existence of large amounts of unrecorded man-made pollution makes it unrealistic to attempt to maintain high levels of dissolved oxygen by treatment above. Induced river aeration may be not only the most economical alternative but the only practicable means of achieving such goals. (Whipple-Rutgers)

WASTE DISPOSAL COSTS OF A FLORIDA PHOSPHATE OPERATION,
Bureau of Mines, Knoxville, Tenn. Knoxville Office of Mineral Resources.
J. R. Boyle.
Available from U. S. Gov't. Printing Office, Wash., D. C., for 35 cents.

Descriptors: Construction costs, Dam design, Earth dams, Environment, Flocculants, Hydraulic excavation, *Phosphates, *Pollution abatement, Research and development, Resource conservation, Slimes, *Waste disposal, Water conservation, *Water costs, Water management, *Water pollution source, Water recirculation.

The waste disposal method used at the International Minerals and Chemical Corporations's Noralyn Phosphate Operations in Polk County, Fla., was studied to develop cost estimates, provide better knowledge of current practices, guide consideration of alternative methods and identify possible areas of research. Cost estimates were based on capacities of existing facilities, but the phosphate production and slime generation statistics used in the calculations were estimates rather than data drawn from company records. Cost estimates represent a basis for calculating waste disposal costs for other phosphate plants which utilize the same method of disposal. Total operating cost of disposal is estimated to be 33.0 cents per ton of product based on an assumed 4.5 million tons of slime per year. Net operating cost is estimated to be 24.5 cents per ton of product after credit of 8.5 cents per ton for recirculated water from the settling ponds to the plant. To conserve mineral resources and to improve environmental conditions, research should be directed to developing alternative methods of disposal, including the recovery of the P2O5 values from the slimes and the dewatering of the slimes.

ESTUARINE WATER QUALITY MANAGEMENT,
California State Water Resources Control Board, Sacramento. San Francisco Bay-Delta Program.
Richard L. Rosenberger, and Raymond Walsh.
ASCE Proc, J Sanit Eng Div, Vol 94, No SA5, Pap 6164, pp 913-926, Oct 1968. 14 p, 3 fig, 4 ref.

Descriptors: *Water quality control, *Estuaries, *California, Water resources development, Water management (Applied), Sewage treatment, Water pollution control, Deltas.
Identifiers: San Francisco Bay.

The San Francisco Bay-Delta Water Quality Control Program is a 3-yr study to develop a comprehensive plan for water quality control in the San Francisco Bay-Sacramento-San Joaquin Delta area of California. The program's total study area covers nearly 40% of the state. Vast water development projects will ultimately result in the complete control of inflow to the Delta and Bay during a substantial portion of most years. In developing a comprehensive water quality control plan the effect these projects will have on water quality must be considered along with problems resulting from disposal of agricultural drainage and the more conventional water pollution related factors associated with population and economic growth. The ultimate plan for water quality control in the Bay-Delta area, to be completely successful, will need to have incorporated into it the concepts of total water resources management. The implementation of such a plan will require the full cooperation of federal, state, and local water development agencies. (Knapp-USGS)

THE ADMINISTRATION OF OFFSHORE MINERAL LEASING STATUTES IN THE GULF OF MEXICO (LOUISIANA AND TEXAS),
G. Hardy, III.
Nat Resources Lawyer, Vol 1, No 3, pp 70-102, July 1968. 33 p, 62 ref.

Descriptors: *Louisiana, *Texas, Leases, *Land use, Federal jurisdiction, State jurisdiction, Natural resources, Administrative agencies, Conservation, Boundaries (Property), Oil, Gases, Sulfur, Shores, Coasts, Mineral industry, Gulf of Mexico, Marine geology, Interagency cooperation, Federal-state water rights conflicts.

The author traces the history and the past
present problems encountered by the states
Louisiana and Texas in establishing and adminis
ing leasing statutes and policies regarding offsh
areas. He reveals in detail the administrative str
ture and operation of, respectively, the Louisi
State Mineral Board and the School Land Boar
Texas. Sample offshore leases from both states
included as appendices to the article. The aut
notes the leasing custom and practice in b
states. He utilizes the bulk of the article to descr
various problem areas regarding offshore lea
which both Louisiana and Texas have faced and
compares the policies and efforts of the two st
to meet such problems. Among the problem ar
he discusses are: (1) the impact of offshore leas
of land for oil and gas operations on compet
uses of marine resources, (2) various adminis
tive problems, (3) the federal-state relationsh
regarding the administration of offshore lan
specifically, pollution, conservation, and bound
problems, and (4) intergovernmental relati
within each state as regards the leasing of offsh
lands. (Carruthers-Fla)

POLLUTION ABATEMENT AND CONTROL.
W Va Code Ann sec 20-5A-9 thru 20-5A-14 (1966), as amended, (Supp 1968).

Descriptors: *West Virginia, *Water pollution control, *Pollution abatement, *Disposal, Water pollution sources, Water pollution treatment, Water conservation, Legal aspects, Legislation, Public health, Sewage, Sewage disposal, Waste water disposal, Effluents, Industrial wastes, Permits, Administrative agencies, Discharge (Water$_0$.

The chief of the state's division of water resources may require persons who directly or indirectly discharge sewage or other wastes into or near waters of the state to file information concerning the characteristics, amount, and rate of flow of the discharge. Upon determining that any person is causing water pollution, the chief may issue orders requiring either that the waste discharge be halted, or that remedial action be taken to reduce pollution in the discharge to the extent that such action is practical and economically feasible. If the order requires remedial action, the person causing the pollution must seek a permit and begin appropriate steps to eliminate or reduce pollution in accordance with the order. Failure of the governing body of a municipality or corporation to vote funds for necessary action will not excuse non-compliance. The chief may extend the time limit fixed by his original order. Compliance with a past order issued by the division implies no right to continue existing pollution of the state's waters, and the state maintains the right to take necessary action in the future. (Kelley-Fla)

The state board of health is created to assume the obligations of all previously existing health agencies. The board has the duty of enforcing all laws respecting public health. It can inspect and control the sanitary conditions of streams, water supplies, and sewage facilities. The board may regulate public water systems, plumbing systems, sewage systems and treatment plants, swimming pools, chlorination and filtration plants, and the qualifications of those in control of the plants. A municipality may not establish any method of drainage unless such method shall be approved by the state department of health. If the department finds that an existing system is dangerous to public health, it may order alterations in such system. The board of health shall prescribe the bacteriological limits to which all public water supplies will conform. The board may also prescribe regulations limiting the chemical and physical qualities of water. (Shevin-Fla)

PROTECTION OF NAVIGABLE WATERS - REGULATION OF TRANSPORTATION AND DUMPING REFUSE IN NAVIGABLE WATERS - PIERS AND CRIBS ON MISSISSIPPI AND ST CROIX RIVERS.

33 USCA secs 419, 420 (1957).

Descriptors: *Waste disposal, *Federal government, *Legislation, *Navigable water, Transportation, Oysters, Dredging, Navigation, State jurisdiction, Piers, Mississippi River, Federal jurisdiction, Federal-state water rights conflicts, Water resources development, Navigable rivers.
Identifiers: St Croix River, Corps of Engineers.

The Secretary of the Army is authorized to prescribe regulations to govern the transportation and dumping into any navigable water, or waters adjacent thereto, of dredgings, earth, garbage, and other refuse materials of every kind or description, whenever in his judgment such regulations are required in the interest of navigation. Such regulations shall be posted in conspicuous places for the information of the public, and any person or corporation which shall violate the regulations shall be deemed guilty of a misdemeanor. This section does not apply to any waters within the jurisdictional boundaries of any state which are now or may hereafter be used for the cultivation of oysters under the laws of such state, except navigable channels which have been or may hereafter be improved by the United States. The owners of sawmills on the Mississippi River and the Saint Croix River in the states of Wisconsin and Minnesota are authorized to construct piers or cribs in front of their mill property on the banks of the river, provided that the piers or cribs so constructed shall not

LIBRARY U. OF I., URBANA-CHAMPAIGN

interfere with or obstruct the navigation of the river. (SmithnFla)
W69-07647

PROTECTION OF NAVIGABLE WATERS - DEPOSIT OF REFUSE IN LAKE MICHIGAN NEAR CHICAGO.

33 USCA sec 421 (1957).

Descriptors: *Lake Michigan, *Water pollution control, *Federal government, *Legislation, Lakes, Waste disposal, Navigation, Illinois, Water supply, Indiana, Breakwaters, Federal jurisdiction, Navigable water, Federal-state water rights conflicts, Water resources development, Navigable rivers.
Identifiers: Corps of Engineers.

It is unlawful to discharge or cause to be discharged any refuse matter of any kind into Lake Michigan at any point opposite of Cook county Illinois or Lake county Indiana, within eight miles from the shore of the lake, unless such refuse shall be placed inside of a breakwater so arranged as not to permit its escape into the body of the lake and cause contamination. The provisions of this section do not apply to the construction, repair, and protection of breakwaters and other structures built in aid of navigation, or for the purpose of obtaining water supply. Any person violating any provision of this section is guilty of a misdemeanor. (Smith-Fla)
W69-07648

OIL POLLUTION OF COASTAL WATERS - PROHIBITION AGAINST DISCHARGE OF OIL IN UNITED STATES WATERS.

33 USCA secs 431, 432, 433, 434 (1957).

Descriptors: *Oil, *Water pollution control, *Federal government, *Legislation, Water pollution, Coasts, Ships, Navigation, Public health, Federal jurisdiction, Navigable waters, Federal-state water rights conflicts, Water resources development, Navigable rivers.
Identifiers: Secretary of the Army.

Except in case of emergency, imperiling life or property, or unavoidable accident, collision, or stranding, and except as otherwise permitted by regulations prescribed by the Secretary of the Interior, it is unlawful for any person to discharge or permit the discharge of oil from any boat or vessel into or upon the navigable waters of the United States and its adjoining shorelines. Any person discharging or permitting the discharge of oil from any vessel into such waters shall remove the vessel from the waters immediately. If such owner fails to do so, the Secretary may remove the oil or may arrange for its removal, at the owner's expense. These coasts and expenses shall constitute a lien on such vessel which may be recovered in proceedings by libel in rem. Any person who violates this section is punishable upon conviction by a fine not exceeding $2,500, or by imprisonment not exceeding one year, or by both fine and imprisonment for each offense. Any boat or vessel, other than those owned and operated by the United States, from which oil is discharged in violation of this section shall be liable for a penalty of not more than $10,000. (Smith-Fla)
W69-07656

THE DEPOSIT OF REFUSE IN N Y HARBOR AND ADJACENT WATERS IS PROHIBITED.

33 USCA secs 441, 442, 443, 444 (1957).

Descriptors: *New York, *Waste disposal, *Legislation, *Federal government, Sewers, Harbors, Permits, Ships, Federal jurisdiction, Navigable waters, Federal-state water rights conflicts, Water resources development, Navigable rivers.

The placing or discharging in any manner of refuse, dirt, dredgings, or other matter in the waters of the harbors of New York, Hampton Roads, or Baltimore, within the limits which shall be prescribed by the supervisor of the harbor, is forbidden. A violation of this section is a misdemeanor punishable by fine or imprisonment. In addition to the above penalties, any master or engineer, or persons acting in that capacity, on board any vessel who knowingly violate this section shall, upon conviction, have his license revoked or suspended for a term to be fixed by the judge. Whenever any such forbidden matter is received on board any scow or other vessel, the owner or master, before proceeding to take or tow the refuse to the place of deposit, shall apply for a permit defining the precise limits within which the discharge may be made. Any deviation from such discharging place specified in the permit is a misdemeanor. (Smith-Fla)
W69-07657

WATER POLLUTION CONTROL - CONGRESSIONAL DECLARATION OF POLICY.
33 USCA secs 466, 466-1, 466a, 466b, 466c (1967 Supp).

Descriptors: *Water policy, *Water pollution control, *Federal government, *Legislation, State jurisdiction, Pollution abatement, Cost sharing, Administrative agencies, Water pollution, Surface waters, Groundwater, Coordination, Water pollution sources, Federal jurisdiction, Navigable waters, Federal-state water rights conflicts, Water resources development, Navigable rivers, Cities.
Identifiers: Secretary of Health, Education and Welfare.

The policy of Congress concerning waterways is to recognize, preserve and protect the primary responsibilities and rights of the states in preventing and controlling water pollution, to support technical research relating to the prevention and control of water pollution, and to provide federal technical services and financial aid to state and interstate agencies and to municipalities in connection with the prevention and control of water pollution. A Federal Water Pollution Control Administration is created within the Department of Health, Education and Welfare by this section. The Secretary shall prepare comprehensive programs for eliminating or reducing the pollution of interstate waters and tributaries and improving the sanitary condition of surface and underground waters. The Secretary shall encourage cooperative activities by the states for the prevention and control of water pollution, and encourage the enactment of improved uniform state laws relating to the prevention and control of water pollution. (Smith-Fla)

WATER POLLUTION CONTROL - GRANTS FOR WATER POLLUTION CONTROL PROGRAMS - WATER POLLUTION CONTROL ADVISORY BOARD.

33 USCA sec 466d to 466h (1967 Supp).

Descriptors: *Water pollution treatment, *Federal government, *Legislation, *Navigable waters, Water pollution waste treatment, Sewage, Sewage treatment, Waste disposal, Water purification, Industrial pollution, Cost sharing, Administrative agencies, Federal jurisdiction, Federal-state water rights conflicts, Water resources development, Navigable rivers, Cities.
Identifiers: Secretary of Health, Education and Welfare, Water Pollution Control Advisory Board.

Five million dollars is authorized to be appropriated for the fiscal year ending June 30, 1967, and for each succeeding fiscal year to and including the fiscal year ending June 30, 1971. The Surgeon General is authorized to make grants to any state, municipality, or intermunicipal or interstate agency for the construction of necessary treatment works to prevent the discharge of untreated or inadequately treated sewage into any waters. This section enumerates the limitations of such federal grants and requires a determination of the desirability of all proposed projects. A Water Pollu Control Advisory Board is established within Department of Health, Education, and Welfar is composed of the Secretary or his designee, shall be chairman, and nine members appointe the President, none of whom shall be federal ficers or employees. The pollution of interstat navigable waters in or adjacent to any state states which endangers the health or welfare of persons shall be subject to abatement action as vided in this section. Any federal department agency having jurisdiction over any building, in lation, or other property, shall, insofar as pract ble, cooperate in preventing the pollution of waters with the Department and any state or a cy having jurisdiction over waters into which matter is discharged from such property. (Sm Fla)

DAUGHERTY V CITY OF LEXINGT (REASONABLE USE OF LAND).

249 SW 2d 755-759 (Ky 1952).

Descriptors: *Kentucky, *Reservoir stor *Reasonable use, *Sewage disposal, Local gov ments, Natural use, Water pollution sources, C sumptive use, Sewage treatment, Water sup Water storage, Water rates, Remedies, Judi decisions, Public benefits, Land tenure, Compe tion.

Plaintiff owned land near and above a priva owned artificial lake from which the City of L ington obtained its water. The county board of justment refused to grant plaintiff a permit to e a restaurant and tourist cabin, fearing that sewage from such businesses might pollute the ty's water supply. Plaintiff brought suit to rev this action. Plaintiff contended that his sewage trol system was adequate and that to deny him reasonable use of the land would be the equiva

f taking his property without compensation. loreover, such taking would not be for the benefit f the public but for the benefit of the private water ompany. Plaintiff appealed from a dismissal of his uit in the circuit court. The court affirmed the ower court's action, noting that the water comany, whose rates were regulated by the state, was reality only a management corporation allowed make a reasonable profit. The public had a irect interest in preventing appellant from using is land so as to endanger the public's water source, nce any added purification costs would be eflected in their water rates. 06. WATER RESOURCES PLANNING

6A. Techniques of Planning

OPERATIONS RESEARCH STUDY OF WATER RESOURCES IN AN URBANIZED ARID ENVIRONMENT,
Arizona Univ., Tucson.
Chester C. Kisiel, and Lucien Duckstein.
International Conference on Arid Lands in a Changing World, Arizona University, Tucson, June 3-13, 1969. 24 p, 4 fig, 2 tab, 33 ref, map.

Descriptors: *Systems analysis, *Water resources planning, *River basin development, *Arid lands, River forecasting, Runoff forecasting, Competing uses, Conservation, Water management (Applied), Project planning, City planning, Long-term planning, Short-term planning, Economic efficiency, Estimating equations, Computers, Arizona.

This paper briefly reviews the philosophy of systems analysis or operations research, presents a progress report on application of this methodology to water resources development and management in the Tucson basin, Arizona, and presents a strategy for a study of the efficiency of data collection systems. Emphasis is on an integrated systems approach with the Tucson area as a field laboratory for improvement of methodology. Details of the basins water problems include economic growth, mining industry, agriculture and the municipal sector. Digital computer models of the physical system consider transferability of point precipitation data, time series analysis of actual stream flows and variability of natural recharge. Two different management approach models are examined for a community water supply, (a) to meet projected requirements at minimum costs, (b) to maximize net benefits accruing from water use. Efficiency of data collecting systems are evaluated in terms of economic efficiency, information content and worth in terms of construction of mathematical models of the physical system and water management schemes. The objectives of groundwater management models for the Tucson basin are enumerated. (Sherbrooke-Ariz)

DYNAMIC PROGRAMMING IN WATER RESOURCES DEVELOPMENT,
Texas Univ., Austin; and Texas A and M Univ., College Station.
C. S. Beightler, and W. L. Meier.
Proc, Nat Symp Anal Water-Resource Syst, pp 64-71, Denver, July 1968. 8 p, 3 fig, 10 ref.

Descriptors: *Dynamic programming, *Water resources development, Optimum development plans, Decision making, River systems.
Identifiers: *Non-serial systems.

The technique of dynamic programming for determining the optimum level of development in water resource systems was outlined. The recursive relationship for a serial multistage system was developed. State variables were the inputs and outputs (e.g. flows) at each stage. The decision variables were the levels of development at each stage. Transformation functions relating inputs and development levels to outputs at each stage were assumed. The objective was to maximize the returns (functions of inputs and levels of development at each stage) from the system. The technique was then generalized to a branched system, with the recursive optimization technique working upstream as before until the first branch was reached. There, the two-decision, one-state optimization step was decomposed by the Principle of Optimality into an equivalent one-state, one-decision optimization. It was concluded that using the 'pseudo-stages' which resulted from the decomposition, that any branched multistage problem could be solved as a one-state, one-decision serial dynamic programming problem. SYSTEMS ANALYSIS AND BASIN PLANNING FOR WATER RESOURCES MANAGEMENT,
Illinois State Water Survey, Urbana.
Robert H. Harmeson.
Proc, Nat Symp Anal Water-Resource Syst, pp 72-78, Denver, July 1968. 7 p, 2 fig.

Descriptors: *Systems analysis, *Water management (Applied), *River basins, *Planning, Water resources development, Water pollution control, Water supply, Recreation, Flood control, Air pollution.
Identifiers: Illinois Water Resources Model.

An effort by the State of Illinois to develop methodology of systems analysis, which could be used in devising the general strategy for the coordinated planning of water resources development and management throughout the state, was reported. A report entitled 'Water for Illinois--A Plan for Action', which addressed itself to the problems of water and land-related resources for the target dates of 1980 and 2020, was outlined. The report recommended the use of a comprehensive and detailed systems analysis of the State's total water resource, relating to water supply and use, water quality control, recreational water use, flood control, and to soil and water conservation measures. To develop an Illinois Water Resources Model, the state was divided into eight quasi-river basin areas. An attempt to develop sub-models for the various stated purposes, and to integrate the sub-systems into a regional optimization model was discussed. For main entry see W69-07562. (Gysi-Cornell)

SYSTEMS ANALYSIS FOR WATER SUPPLY AND POLLUTION CONTROL,
Harvard Univ., Cambridge, Mass.
Joseph J. Harrington.
Proc, Nat Symp Anal Water-Resource Syst, pp 144-166, Denver, July 1968. 23 p, 82 ref.

Descriptors: *Systems analysis, *Water supply, *Water pollution control, *Mathematical models, Sanitary engineering, Water distribution (Applied), Cost analysis, Waste water treatment, Waste water disposal, Water treatment, Regional analysis, Engineering education, Demand, Publications, Reviews.

The stated purpose of the paper was 'to give a cursory overview of applications of systems techniques to the provision of water and the collection and acceptable disposal of waste water.' An extensive listing of past and present systems studies in the water supply-disposal area followed. The background and traditional approach to water supply and dispoal design problems was given. Studies on the development of cost data for design were listed. Systems studies for water distribution system design, maintenance (leak detection and metering), waste water treatment, unit processes, staged development of treatment works, suburban waste water disposal, metrology-automation and control, and miscellaneous studies in water treatment, waste water collection, regionalization, demand estimation, parameter estimation and model design, phase interchanges and social implications of engineering systems, and curriculum considerations were briefly described. It was concluded that most existing models are sub-optimization models and should be regarded as 'preliminary screening' tools that serve as guides but which must be tempered by judgment. RITON CITY: A PROTOTYPE FLOATING OMMUNITY.
riton Foundation, Inc., Cambridge, Mass.
Available from Clearinghouse for Federal Scientific and Technical Information, Springfield, Va., as report PB-180 051 at $3.00 in paper copy and $0.65 in microfiche, November 1968. 15 p, 1 append, 23 ref.

Descriptors: *Waterfront development, *Community development, *Prototypes, Structural design, Neighborhood development, Social aspects, Population density, Economic feasibility, Technical feasibility.
Identifiers: *Floating community.

A feasibility study to determine the possibility of developing the water areas of major cities by floating new communities on the water adjacent to the urban core, the technical considerations indicate that such a structure is possible. The basic unit of Triton City is a neighborhood-sized community which will accommodate 3500 to 6000 people and which will support an elementary school, a small supermarket and local convenience stores and services. Three to six of these neighborhoods will form a town which will include a high school, more recreational and civic facilities and possibly light industry. When a community reaches the level of three to seven towns (90,000 to 105,000 population) it becomes a full-scale city with more specialized industry and a city center module to accommodate government offices and medical facilities. The high density occupation results in great economies in transportation service and other utilities. One of the other important benefits of this type of development is the advantage of waterfront living in the central city - urban convenience and suburban open space. (Starr-Chicago)

WATER RESOURCES PROBLEMS AND RESEARCH NEEDS,
A. W. Snell.
Water Resource Research Institute, Clemson University, S. C. Proceedings - Sixteenth SWRPCC - 1967, pp 161-167. 7 p, 8 ref.

Descriptors: *Research and development, Systems analysis, Flood plains, Industrial wastes, Judicial decisions, Site selection, Economic impact.
Identifiers: Local participation.

Research needs for effective water resources planning are cited in this article. They include: (1) Economic value of water in various uses; (2) impact of water resources development on economic growth; (3) economics of management of flood plains; (4) the biochemical effect of present and projected disposal practices of industries and municipalities; (5) economics of site selection; (6) compilation of court decisions and statute laws relating to water use and water rights; and (7) compilation of population and industrial projected needs to determine probable demand. Additional requirements which should not be overlooked include the use of systems analysis applied to problems in water resources and generating local interest in water resources development. (Starr-Chicago)

WATER RESOURCES DEVELOPMENT OF MULLICA RIVER BASIN, NEW JERSEY,
Rutgers - The State Univ., New Brunswick, N. J. Water Resources Research Inst.
James B. Durand, Marvin L. Granstrom, and George H. Nieswand.
OWRR Project B-014-N.J. June 1969. 4 p.

Descriptors: Ecosystems, Aquatic life, Nutrient requirements, Conjunctive use, Systems analysis, Estuary, New Jersey.
Identifiers: *Mullica River Basin, Bay-river system.

The eventual use of the Mullica River basin for water supply will affect the ecosystems in the river-bay complex. Over a period of almost a decade, a biologist group has been observing the physical, chemical, and biological characteristics of the complex. Recently, an engineer group has joined the biologists. The engineers' objectives are to develop methods of orderly planning the optimization of water supply development and minimization of the effect of fluvial water withdrawal on the bay-river system.

THE ECONOMIC IMPLICATIONS OF THE INTERCONNECTION OF URBAN WATER SYSTEMS,
Temple Univ., Philadelphia.
Paul Seidenstat.
Philadelphia, Bureau of Economic and Business Research Occasional Paper no. 2, 1969. 25 p. OWRR-14-01-0001-1976.

Descriptors: *Water supply, *Water utilization, *Water resources development, *Water shortage, Water distribution (Applied), Water management (Applied), Planning, Economic efficiency.

This paper examines the market for water sold by public water systems in the Philadelphia metropolitan area to determine the economic feasibility of water interchange among contingent water systems. Analysis of the supply network and pattern of water use presented in several tables reveals considerable unused capacity at both the raw and treated water levels for many systems; however, a few are plagued by occasional deficiencies. Projections of future use indicate the continuance of much excess supply. The coexistence of 'surplus' and 'deficit' suppliers has led to a practice of tradeoffs - either on an emergency or a continuing basis. Not only are present interconnections economically feasible but there is also considerable potential for future ones. A regional approach to water system development might eliminate much of the apparent economic waste related to excess capacity.

WATER AND THE CITIES: CONTEMPORARY URBAN WATER RESOURCE AND RELATED LAND PLANNING,
Abt Associates, Inc., Cambridge, Mass.
P. Raven-Hansen, J. M. Yudelson, and M. J. White.
Available from Clearinghouse as PB 184 699 at $3.00 in paper copy and $0.65 in microfiche. Cambridge, Massachusetts, Abt Associates, Inc. OWRR Project C-1469. June 30, 1969. 507 p.

Descriptors: *Water pollution control, *Water quality management, *Waterfront land use, *Recreation, Storm water drainage, Combined sewer overflows, Sewer separation, Municipal waste treatment, Chlorination/detention tanks, Holding tanks, Sludge disposal, Urbanization, Hydrologic environment, Systems Analysis.
Identifiers: *Social planning, *Deep tunnel flood and pollution control, *Psychological public goods, Boston, Chicago, Columbia, Detroit, Little Rock, Los Angeles, New Orleans, Pittsburgh, San Antonio, Seattle, Waterfront striplands, Recreation standards, Blue-green drainage planning.

Ten case studies of urban water resources and related land planning are presented, based on interviews with urban planners, citizens' groups, and engineering consultants, and on current planning documents from each city. Water quality management, waterfront land use, water-related recreation and open space, and metropolitan growth are identified as critical problem-areas in planning the interactions of urban activity and the water resource. The lack of feedback from planning engineers to the regulatory agencies which set water quality standards is identified as a major constraint on efficient water qualtiy management and planning. The inability to respond to changing land uses is identified as a major constraint on waterfront land use planning. A neglect of the distributional aspects of urban water recreation development is identified as a constraint on the effectiveness of its planning. Jurisdictional fragmentation and/or competition is identified as a constraint on

LIBRARY U. OF I., URBANA-CHAMPAIGN

the planning and control of metropolitan growth. From the analysis of the planning experience, general guidelines for urban water resources planning in the four problem-areas are formulated in the language of systems analysis.

6C. Cost Allocation, Cost Sharing, Pricing/Repayment

METHODS OF FINANCING STATE PARTICIPATION IN WATER RESOURCES DEVELOPMENT,
Kansas Water Resources Research Inst., Manhattan.
Darwin W. Daicoff.
Contribution No 4, Kansas Water Resources Research Institute, Kansas State University, Research conducted September 1965 - August 1966. 34 p. OWRR B-003KAN.

Descriptors: *Financing, *Cost allocation, Interagency cooperation, Cost-benefit analysis, Taxes, Economic efficiency, Administrative agencies, State jurisdiction, Legal aspects, Federal jurisdiction, Kansas, Texas, Wisconsin.
Identifiers: User charges, Spillover benefits, Local jurisdiction.

The objective is to determine the most efficient revenue system for a water resources development project. Section I, the body of the report, incorporates a discussion of spillover benefits and the cost allocation problems they create into an analysis of the interjurisdictional relationships involved in revenue system. Sub-topics discussed include the problem of choosing an agency to administer the revenue structure; the reasons that financing should be administered by legal coercion rather than voluntary cooperation; the change in state and local roles depending on whether the places of benefit and residence are the same; and the legal precedents for federal supervision of financing found in federal laws and in Kansas laws and policies. Section II, assuming a fixed revenue system examines the way to compose a particular project. The method of benefit-cost analysis is discussed and its proper application to the determination of a project's composition is described. Section III analyzes the relative merits of user charges and taxes, and examines the appropriateness of Texas and Wisconsin revenue procedures. Results show that an 'economically proper' revenue system cannot be constructed because the projects themselves do not use any economic efficiency criterion in determining their composition. A STUDY OF THE EXPENDITURES FOR URBAN WATER SERVICES,
Travelers Research Corp., Hartford, Conn.
LeRoy H. Clem.
ASCE Urban Water Resources Res Program Tech Mem No 7, February 1969. 21 p, 2 tab, 11 ref. OWRR Contract No 14-01-0001-1585. Available from Clearinghouse as PB 184 702 at $3.00 in paper copy and $0.65 in microfiche.

Descriptors: *Municipal water, *Water costs, *Connecticut, Cost analysis, Water sources, Water supply, Storm runoff, Water treatment, Water pollution control, Operating costs, Construction costs, Economics, Water rates.
Identifiers: Hartford (Conn).

A study was undertaken to determine the feasibility of and provide guidelines for analyzing all urban water service costs and to determine their relationship to other local government expenditures, such as education, public works, and law enforcement. The City of Hartford was chosen for the pilot investigation because the manager's fiscal practices were suitable and appropriate records were available, and the cooperation of key city personnel was promised. Total cost of Hartford's water services has decreased from $8.5 million (17.4% of annual city budget) in 1965 to $5.1 million (7.4% of budget) in 1968. The decrease is due to completion of a major storm drainage project. Water sales were nearly constant at about $2.4 million during each of the 4 years under review. The city is the major participant in the local metropolitan water district which also embraces many adjacent towns. Hartford has over the years been subjected to catastrophic flooding from the Connecticut River. Local efforts and the Corps of Engineers have worked in conjunction to eliminate the flooding problem, but the city has low-lying areas requiring storm runoff pumping. At present, the sewerage and storm drainage systems are combined but steps are being taken to separate them. Urban water service costs can be analyzed and their relationship to other local expenditures determined. An approach recommended for nationwide studies is given. (Knapp-USGS)

6D. Water Demand

WATER – OUR ENGINEERING RESPONSIBILITY,
A. W. Snell.
Agricultural Engineering, Vol 48, No 12, pp 707-709, December 1967. 3 p, 12 ref.

Descriptors: *Water demand, *Water use, *Water quality, Social impact, Political aspects.
Identifiers: Alternative plans.

The main thesis of this article is that while there will be no major national water shortage there will be the problem of distribution in time and space and of preserving a suitable quality. There will be local water shortages caused by dense population with high needs. There will also be conflicts of interest and demand for the same source of water and conflicts which develop because of the effect one user has on the quality for subsequent users. Solving these problems will require that full consideration be given to the prevailing physical characteristics, the economies of the plan, the economies of available alternatives, the effects of each alternative on the social condition of the people, and the political decisions that must be made. 6E. Water Law and Institutions

APPLICATION OF HUIE (CONDEMNATION AWARDS).

2 A D 2d 786, 154 NYS 2d 242 (1956).

Descriptors: *New York, *Condemnation value, *Withdrawal, *Streams, Judicial decisions, Legal aspects, Compensation, Cities, Recreation, Eminent domain, Relative rights, Rivers.

Claimants own property near a river to which they have recreational rights subject to an intervening riparian owner's right to deplete any or all of the water. Petitioner acquired the riparian interest in order to make use of the river for water supply purposes. The court held that the appraisal commissioner's award of damages to the claimants was excessive in view of the fact that the previous riparian owner could have depleted all of the waters without becoming answerable to claimant. UNITED STATES EX REL TVA V 137 ACI OF LAND (PROPER COMPENSATION IN C DEMNATION PROCEEDING).
406 F 2d 1283-1289 (6th Cir 1969).

Descriptors: *Tennessee, *Tennessee Va Authority Project, *Condemnation, *Compe tion, Road construction, Legal aspects, Judi decisions, Administrative agencies, Emi domain, Federal government, Tennessee Ri Dams, Reservoirs, Highways, Recreational fa ties, State governments, Bridges, Damages, Fl ing, Ditches, Parks, River Basin development, C tracts, Condemnation value, Roadbanks.

In an action for condemnation of certain lands use by the Tennessee Valley Authority, the lo court awarded the landowners $34,000 and t appealed. Prior to the taking by the TVA, the S of Tennessee had taken a 12-acres plot of the l in question in order to build a highway. highway project increased the value of the l since it was made suitable for restaurants, mo and other purposes. The landowners conten that the enhancement in value of the prop brought about by the highway project should in to their benefit rather than to the TVA. TVA c tended that their project brought about establ ment of the interchange and that the landown should not be entitled to any enhancement in va The court found that the enhancement in value not brought about by the proposed dam, but by proposed state highway improvement. The c held that the burden of proving that the pro brought about the enhanced value of the land on TVA and that it failed to meet this burden. court held the landowners were entitled to value of their land on the date of the taking. court found that the highway project was plan prior to the TVA's taking and thus held the l downers entitled to an award of $97,500. There has been an upsurge in the number of rec legal developments concerning marine envir ment. Interest is being focused internationally u the question of the seaward limit of the contine shelf regime embodied in the Geneva Convent on the continental shelf as well as the issue of w legal regime applies or should apply to the s oceanic resources beyond the continental sh regime. On the domestic side, recent cases h arisen involving where the coast line of individ states is to be measured from under the Submer Lands Act. Questions of state sovereignty o reefs lying within the contiguous zone of tw miles but beyond the traditional three-mile li arose in a recent Florida case. These issues discussed in detail. (Katz-Fla)

THE MARINE ENVIRONMENT – RECE LEGAL DEVELOPMENTS,
Oliver L. Stone.
Nat Resources Lawyer, Vol 11, No 1, pp 26-32, 1969. 21 p, 25 ref.

escriptors: *United States, *United Nations, *International law, *Submerged lands act, Texas, orida, Louisiana, Alabama, Gulf of Mexico, Atntic Ocean, Oceans, Mineralogy, Continental elf, Continental margin, Coasts, Coastal plains, eds under water, Ownership of beds, Oil industry, cploitation, Legal aspects, Usufructuary right, Jucial decisions, Reasonable use, Navigable waters, arbors, Bays, Offshore platforms, Riparian land, ibsoil, Subsurface investigations, Drilling, Conctive use, Legislation, Structures.

ne supreme court, in United States v Louisiana, eld that under the Submerged Lands Act a state ay claim a seaward boundary to a three-mile oint from its coastline or may claim a coastline sed on its historic boundary. An historically sed coastline must be measured as it existed on e date of the claimant state's entry into the nion. Under the Convention on the Territorial a a bay is delineated by the semicircle test. This st, accepted by the United States, requires that a y comprise at least as much water area within its osing line as would be contained in a semicircle th a diameter equal to the length of the closing e. In United States v Ray, certain parties asserted e right to erect a structure on reefs located ten iles off the Florida coast. The court, in enjoining e defendants from further activity, noted that the abed of the outer continental shelf adjacent to e United States appertains to the state and is subct to federal control, jurisdiction and power of sposition. HE MARINE ENVIRONMENT -- RECENT EGAL DEVELOPMENTS,
iver L. Stone.
at Resources Lawyer, Vol 11, No 1, pp 32-43, Jan 969. 21 p, 25 ref.

escriptors: *United States, *United Nations, *International law, *Submerged lands act, Texas, orida, Alabama, Louisiana, Reefs, Gulf of Mexo, Atlantic Ocean, Oceans, Structures, Coasts, egislation, Mineralogy, Continental shelf, Conental margin, Coastal plains, Beds under water, wnership of beds, Oil industry, Exploitation, gal aspects, Usufructuary right, Judicial decions, Reasonable use, Navigable waters, Harbors, ys, Offshore platforms, Riparian land, Littoral, bsoil, Subsurface investigations, Drilling.

ne Marine Resources and Engineering Developent Act authorizes various studies to be unrtaken relating to marine resources. A recent udy suggests redefining the continental shelf, endg it at the 200 meter isobath with a buffer zone of miles being established between the 200 meter e and the deep sea. The coastal state would leave clusive rights of exploitation within the buffer ne. The existing shelf regime accepted by 39 naons presently extends beyond the 200 meter obath and it is questionable that these states ould be willing to surrender 'vested' rights. The ational Petroleum Council recently concluded at coastal states have exclusive jurisdiction over e natural resources of the continental land mass award to where the submerged portion of the nd mass meets the abyssal ocean floor. The NPC ted that an urgency to develop a regime for the ean floor beyond national jurisdiction does not esently exist. The author concludes that the arine Sciences Commission report will greatly duce the uncertainty concerned with developing egime for the ocean floor beneath the high seas. atz-Fla)

HE MARINE ENVIRONMENT -- RECENT EGAL DEVELOPMENTS,
iver L. Stone.
at Resources Lawyer, Vol 11, No 1, pp 43-46, Jan 969. 21 p, 25 ref.

escriptors: *United States, *United Nations, *International law, *Submerged Lands Act, Texas, ouisiana, Alabama, Florida, Gulf of Mexico, Atlantic Ocean, Oceans, Mineralogy, Continental shelf, Continental slope, Continental margins, Coasts, Coastal plains, Beds under water, Ownership of beds, Oil industry, Exploitation, Legal aspects, Usufructuary right, Judicial decisions, Reasonable use, Navigable waters, Harbors, Bays, Offshore platforms, Riparian land, Littoral, Subsoil, Subsurface investigations, Drilling.

The Maltese Mission to the United Nations recently proposed that the General Assembly should consider the propriety of making a declaration reserving the seabed and ocean floors beneath the high seas exclusively for peaceful purposes and uses. Such a declaration would not effect waters presently under national jurisdiction. The proposed declaration envisages a treaty which would create an international agency. This agency would act as trustee for all nations over the seabed and ocean floor beyond national jurisdiction. This proposal prompted domestic action in the United States Senate generally in accord with the Maltese proposal, but no definitive action was undertaken by the 90th Congress. The United Nations, in response to the Maltese proposal, has created a Committee of Nations to study the proposal. The Committee failed to reach consensus on the principles to be applied to the proposal. However, the Committee did agree that the area in question will be used only for peaceful purposes and in the interest of mankind. It is also agreed that the rights of coastal states will be respected. If proved impossible to agree to a delineation of the area in question. (Katz-Fla)

SHELLFISH.

Conn Gen Stat Ann secs 19-52 to 19-59 (1960).

Descriptors: *Connecticut, *Shellfish, *Public health, *Pollutants, Legislation, Clams, Commercial shellfish, Mussels, Oysters, Regulation, Baits, Population, Boats, Permits, Shores, Tidal waters, Cities, Commercial fishing, Fish harvest, Docks.
Identifiers: Notice, Penalties (Criminal), Transplantation (Shellfish).

The word 'shellfish' means mussels, oysters, and all varieties of clams. The State Board of Health may inspect shellfish beds, boats, appliances used in preparation of shellfish for market, and all wharves and buildings where shellfish are prepared for shipment or sale. The Board may prescribe regulations for growth, production, and preparation of shellfish for market. All persons dealing in shellfish must obtain certificates of identification, and the Department may require that all shipments be marked in such a way as to identify the shipper. Certification may be revoked after a hearing and upon showing of cause. Any person whose certificate has been revoked may appeal to the county court. The Department may prohibit the taking of shellfish from certain areas which it deems contaminated; however, cities may allow the taking from that area for use as bait. The Department, upon contaminating an area, must publish notice in the local newspapers, file notice in the local department of health, and post notice at the designated area. Any person violating any provisions of the section may be fined or imprisoned. Persons may remove shellfish from contaminated areas and transplant them in approved areas after they have been authorized to do so by the department of health. (Shevin-Fla)

ELIMINATION OF MOSQUITO-BREEDING PLACES.

Conn Gen Stat Ann secs 19-50, 19-51 (1960), as amended, (Supp 1968).

Descriptors: *Connecticut, *Public health, *Mosquitoes, *Swamps, Legislation, Bogs, Coastal marshes, Drainage wells, Marshes, Stagnant water, Larvae, Drains, Landfills, Damages, Ditches, Canals, Regulation.
Identifiers: Tidegates, Breeding, Penalties (Criminal).

The Commissioner of Health may make regulations concerning the elimination of mosquitoes and may enter any swamp, marsh, or land to determine if it is a breeding place and order it drained or filled to eliminate the insects. Notice of the area affected and the operation to be carried out must be published in the town where the land is located, and the owners must be notified by registered mail. The Commissioner shall assess the damage caused to the property and file his assessment in the county court. Any person aggrieved by the plan or the assessment may file for relief in the county courts. When any area has been drained by the Commissioner, he shall keep the area in repair and free from obstruction and make such repairs as will make the work effective. Any person obstructing the work of the Commissioner in so treating mosquito breeding areas shall be subject to fine or imprisonment. (Shevin-Fla)

RAILROADS.

Conn Gen Stat Ann secs 16-82, 16-95, 16-134 (1958).

Descriptors: *Connecticut, *Railroads, *Canals, *Highways, Legislation, Construction, Bridges, Navigable waters, Nonnavigable waters, Transportation, Streams, Bridge construction, Alteration of flow, Highway relocation, Watercourses (Legal), Channels, Design flow, Structures, Boats, Regulation.

Companies may alter the location of its road in order to add to the number of its main tracts and, for that purpose, may take additional land. If an additional bridge over navigable water is required to add to the main track, it shall be constructed according to specifications set by the railroad commission. When railroad construction must intersect a nonnavigable watercourse or public highway, the company must obtain approval of the commission to construct across it. The company must restore the watercourse or highway to its former state and not impair its usefulness. If construction across a highway cannot be done without damage to the highway, the company may, with the approval of the commission, change or alter the highway, but the highway must be maintained in as good a condition as it was before the alteration. The commission may order the location of a canal or watercourse

LIBRARY U. OF I., URBANA-CHAMPAIGN

changed in order to allow the railroad to be more advantageously constructed. The flow of water in a changed watercourse cannot be impaired, and the expense of making necessary changes in order to maintain the watercourse must be borne by the railroad. The section does not apply to canals maintained in a condition of navigation. (Shevin-Fla)

HARBORS AND RIVERS ACT OF CONNECTICUT.
Conn Gen Stat Ann secs 15-13 to 15-16 (1958), as amended, (Supp 1968).

Descriptors: *Connecticut, *Harbors, *Permits, Navigable waters, Navigation, Federal jurisdiction, Ships, Boats, Channels, Legal aspects, Navigable rivers, Legislation, Regulation.
Identifiers: *Pilots.

The superior court of any county adjoining navigable waters may license as many residents of the state as the court deems necessary to act as pilots in the state's waters. The applicants must already hold a license from the authorized federal agency. Applicants must serve an apprenticeship, during which period they shall observe and assist docking by licensed pilots. Applicants must be bonded. Generally, the superior court of any county shall, upon application, fix the rates of pilotage in the waters of that county. All inward and outward bound vessels of foreign bottom and American vessels under register, drawing nine or more feet of water must take a licensed pilot when entering or leaving a state port. Coastal trading American vessels and certain fishing vessels are exempt from this requirement. The commander of any vessel, wholly or partly propelled by power, which travels at a greater rate than six miles per hour when approaching or passing anchored vessels or specified piers and wharves, shall be liable for fines and treble damages for injury which the vessel causes. (Kelly-Fla)
W69-07274

HARBORS AND RIVERS ACT OF CONNECTICUT.

Conn Gen Stat Ann secs 15-8 to 15-12 (1958), as amended, (Supp 1968).

Descriptors: *Connecticut, *Harbors, *Navigation, *Coastal structures, Ships, Boats, Legal aspects, Piers, Docks, Piles (Foundations), Legislation, Channels, Channel flow, Barriers, Navigable rivers, Navigable waters, Regulation.

The harbor master may station under his care all vessels at anchor in the harbor channel and vessels so moored that they may be carried into the channel. The master may remove vessels which, in his judgment, will obstruct navigation, and he may decide to what place in the harbor such vessel should be removed. Any person willfully refusing or neglecting the order of a harbor master subjects himself to possible fines and assessment of costs of removal and legal expenses. A harbor master may be fined and charged expenses for neglecting to remove a vessel obstructing its channel upon application of a person engaged in navigation of the harbor under the master's charge. Owners or occupants of land adjoining any navigable waters, except New Haven and Bridgeport harbors, may dig channels to give vessels free access from wharves or piers on their land to the main channel. No interference with, or obstruction on, land bordering navigable waters will be permitted where the public has the right of access unless the landowner has given permission or there is other legal right to do so. (Kelly-Fla)
W69-07275

HARBORS AND RIVERS ACT OF CONNECTICUT.
Conn Gen Stat Ann secs 15-1 to 15-7 (1958), as amended, (Supp 1968).

Descriptors: *Connecticut, *Navigable waters, *Harbors, Coastal structures, Piers, Docks, Piles (Foundations), Navigation, Coasts, Channels, Ships, Boats, Legal aspects, Legislation, Regulation.

The governor of Connecticut is authorized to appoint a harbor master and a deputy harbor master for each of the harbors of New Haven, Norwich, Bridgeport, Stamford, Norwalk, Stonington, New London, and Branford for terms of three years. Other harbor masters and deputies may be appointed for any town having navigable waters within its limits. Deputy harbor masters have all the powers of harbor masters in the harbors to which they are appointed, subject to the control and direction of harbor masters. Jurisdictions of the harbor masters for Branford and New Haven are extended to adjoining waters. Fines are prescribed for vessels unnecessarily moored in the New Haven channel so as to obstruct the free passage of vessels. The Bridgeport Harbor Master is responsible for supervision of the harbor, tidewaters, all flats and lands flowed thereby, and for removal of obstructions which may interfere with navigation, cause injury to channels, or reduce tidewaters. The harbor master must approve construction of bridges, wharves, piers, dams, fills, or any driving of piles below the high water mark. Unapproved construction shall be deemed by the master a public nuisance, subject to appeal. (Kelly-Fla)
W69-07276

HARBORS AND RIVERS ACT OF CONNECTICUT.
Conn Gen Stat Ann secs 15-1 through 15-26 (1958), as amended, (Supp 1968).

Descriptors: *Connecticut, *Navigable waters, *Navigation, Structures, Harbors, Coastal structures, Boats, Ships, Permits, Channels, Channel flow, Navigable rivers, Piers, Docks, Piles (Foundations), Lighthouses, Water pollution sources, Legal aspects, Legislation, Federal jurisdiction, Coasts, Barriers, Channel flow, Landfills.

The Harbors and Rivers Act of Connecticut provides that harbor masters for specified state harbors and other navigable waters will be selected by the governor. The duties and powers of the harbor masters and their deputies are set forth, and provision for appeal from their decisions is made. Penalties for disregarding directives given by the masters are established. The statute further provides for the qualifications and licensing of pilots for vessels within the navigable waters of the state. Depositing and dumping in navigable waters is generally prohibited by the statute and penalties are provided. (Kelly-Fla)
W69-07277

HARBORS AND RIVERS ACT OF CONNECTICUT.
Conn Gen Stat Ann secs 15-17 to 15-26 (1958), as amended, (Supp 1968).

Descriptors: *Connecticut, *Harbors, *Navigable waters, Navigation, Navigable rivers, Piers, Docks, Piles (Foundations), Landfills, Legal aspects, Legislation, Water pollution sources, Coastal structures, Channels, Barriers, Boats, Ships.

Proprietors or charterers of steamers or other vessels will be subject to fines if furnace refuse from their vessels is thrown into any harbor or river of the state. Obstructions or structures placed in New Haven Harbor without the consent of the board of harbor commissioners may be removed by the board at the owner's expense if the latter fails to remove it under the board's order. No wharf, pier, or other structure may be constructed in specified areas of New Haven Harbor. A party contesting an order by the New Haven Board regarding construction or filling in the harbor may appeal the order to the court of common pleas of New Haven County. Dumping of any substance, except oyster shells, in New Haven Harbor, or near its mouth, is prohibited. Dumping is also disallowed in other harbor areas specified by the statute. Fines will imposed for removal or destruction of a authorized buoy, beacon or floating guide in t waters of Connecticut. Mooring or attaching a vessel to such marker is also prohibited. Loc agents of foreign vessels must meet state residen requirements. (Kelly-Fla)

NATURAL RESOURCES -- SURFACE MINING

W Va Code Ann secs 20-6-1, 20-6-9, 20-6-11, 2 6-12, 20-6-13 (Supp 1968).

Descriptors: *West Virginia, *Mining, *Natur resources, *Land reclamation, Conservatio Legislation, Administrative agencies, Jurisdictio State governments, Federal government, Permit Soil erosion, Aesthetics, Recreation, Public healt Floods, Land use, Water pollution, Mining e gineering, Land development.
Identifiers: *Surface mining.

The department of natural resources has jurisdi tion and control over all aspects of surface minin especially the restoration of affected areas. It w discovered that surface mining causes soil erosio landslides, flooding, pollution, and destroys th land value for agricultural, recreational, an aesthetic purposes. In addition, it counteracts co servation efforts and impairs the health, safety, an welfare of the public. The director of natur resources may avail himself of the services of an state or federal agency. A surface mining operate is required to prepare a complete reclamation pla and submit it to the director for acceptance. N permit application will be approved if it is felt th the rules and regulations will not or cannot be ob served. Some areas are impossible to reclaim an no mining will be allowed on them. The directo

ay also delete any lands which have been over-
rdened by prior surface mining. He is given con-
derable discretion to prohibit use of certain lands
r surface mining operations. It is the duty of the
ining operator to complete reclamation within
e year after his permit has expired. (Stewart-Fla)

MARYLAND DEPARTMENT OF WATER RESOURCES: POWERS AND FUNCTIONS.
Md Ann Code, art 96A:6-9 (1957), as amended, (Supp 1968).

Descriptors: *Maryland, *Water resources development, *Programs, *Multiple-purpose projects, Legislation, Water resources, Administrative agencies, State governments, Multiple purpose, Project planning, Long-term planning, Boundaries (Property), Investigations, Surveys, Research and development, Research facilities, Tidal waters.

The Maryland Department of Water Resources shall be responsible for supervising and planning the multiple purpose development of state waters, and shall prepare a general water resources program in a manner compatible with multiple purpose management on an appropriate geographical unit basis. The Department is authorized and empowered to make surveys, maps, investigations, and studies of state water resources as it may deem necessary to provide it with sufficient information to formulate a program and to perform its duties. The Department is further authorized to contract for research or scientific investigation with appropriate research organizations. The Department may conduct a joint study with the State Departments of Game and Inland Fish and Chesapeake Bay Affairs in order to define the boundaries of tidal and nontidal waters within state jurisdiction. The boundaries determined shall be set forth in Department regulations. In addition, the Department shall exercise those responsibilities reasonably necessary in carrying out legislative intent. SOIL CONSERVATION.
Conn Gen Stat Ann secs 25-106 to 25-109b (1960), as amended, (Supp 1969).

Descriptors: *Connecticut, *Watershed management, *Flood protection, *Conservation, Legislation, Fish conservation, Wildlife conservation, Water law, Interstate compacts, Recreation facilities, Cities, Agriculture, Governors, Government finance, Multiple-purpose projects, Watersheds (Basins), Cities.
Identifiers: Secretary of Agriculture.

The term 'works of improvement' is defined as any single or multi-purpose undertaking for flood prevention or water conservation which includes fish, wildlife and recreational developments in watershed areas not exceeding 250 thousand acres. A watershed area program may be initiated by the legislative body of any municipality requesting the state commissioner of agriculture to review the plan and obtain assistance from the federal secretary of agriculture pursuant to Public Law 566. The commissioner may acquire lands by purchase or eminent domain and may borrow funds from the secretary of agriculture to finance the local share of costs. The commissioner shall control the construction, operation, and maintenance of such works and improvements and shall retain title to any structure exclusive of recreational, fish, and wildlife developments. The state will absorb the cost of relocating any public service company deemed necessary to accommodate any works of improvement. With approval of the governor, the commissioner of agriculture and natural resources may enter into any interstate compact which will facilitate any works of improvement on streams without the state. Municipalities may acquire part of any works of improvement for park and recreational purposes. (Holt-Fla)

BRIDGES.

Minn Stat secs 441.01, 441.15, 441.16, 441.26 to 441.27, 441.46 to 441.48 (1947),as amended, (Supp 1969).

Descriptors: *Minnesota, *Bridges, *Cities, *Construction, Local governments, Navigable waters, Nonnavigable waters, Legislation, Boundaries (Property), Bridge construction, Watercourses, Municipalities, State governments, Administrative agencies, Maintenance, Repairing.

Any first class city is authorized to construct a bridge jointly with another first class city over any natural watercourse forming a boundary between them. Any first class city having navigable waters and under a home rule charter, is authorized to apply to the Secretary of War for the privilege of erecting a public bridge. Any city whose population is less than 20,000 and which is situated on interstate or international waters is authorized and empowered to secure money by bonds or appropriation for the construction and maintenance of bridges over such waters into another state or country. The council of any fourth class city may appropriate reasonable sums to improve and maintain bridges and ferries on roads leading into the city although located outside the county. Any city purchasing any such bridge has power to sell, assign, and transfer it and its approaches to the state or any political subdivision thereof, or any public or state agency. However, any sale or transfer shall not alter or affect the rights, powers, and securities of any bondholders. Any city bordering on navigable or non-navigable waters is authorized to purchase or construct bridges across such waters whether the bridge is within or beyond the city limits. (Stewart-Fla)

Subject to activation by the Boards of County Commissioners, park districts are created. When activiatied, such districts shall be deemed political subdivisions of the state. The park districts shall be either single or multi-county. The park district boards have the power to regulate the use of any lake waters and shore area in the parks. The board is empowered to acquire lands for conservation of state natural resources including streams, lakes, and submerged lands. The Board does not have the power to acquire land located within the boundaries of a city by purchase or condemnation without prior permission. Neither shall the Board have the power to alter, fix, or charge fees for use of the park. The Board shall not cooperate with or borrow from any state or federal organization. The Board has no authorization to cooperate with any city, county or private organization engaged in conservation, recreation, prevention of water pollution, protection of public health and safety, or mosquito abatement. Any county may acquire any land or water areas deemed useful for public park purposes. The county board may prescribe regulations for protection and use of any parks including waters lying within such park. (Stewart-Fla)

WATERS AND WATERCRAFT SAFETY.
Minn Stat secs 361.04 to 361.13 (1966), as amended, (Supp 1969).

Descriptors: *Minnesota, *Boats, *Safety, Water skiing, Water sports, Navigation, Navigable waters, State governments, Legislation, Beaches, Regulation.
Identifiers: Obstruction to navigation.

The operation of watercraft at excessive speed or in a careless manner is a misdemeanor. Reckless operation causing injury or property damage is punishable by a fine of not more than $100 and/or imprisonment not to exceed 90 days. Operating watercraft so as to obstruct navigation or the placing of structures on water for advertising are prohibited. No watercraft may be operated in areas set aside for bathing. No person may operate a watercraft towing a person on skis or other devices without another person in the boat to observe the skier or without being equipped with a curved rearview mirror to observe the skier. No watercraft shall be operated when loaded beyond its safe capacity or equipped with a motor beyond its safe power capacity. It is unlawful to ride on the gunwales or bow of a boat under 26 feet unless the boat is equipped with adequate safety railing. No person shall operate a watercraft while under the influence of alcohol. An operator involved in an accident must render assistance and promptly report the accident to the sheriff. Where penalty is not specifically set out, violation shall be a misdemeanor subject to $100 fine and/or 90 days imprisonment. In addition, violators may be prohibited from operating a watercraft for 90 days. (Kahle-Fla)

e plaintiff brought suit to quiet his title to certain d formed by accretion. The defendant counter- imed to quiet his title. The defendant owned operty on the north bank of the river while the intiff's property was on the south side. The cru- l issue to be resolved was which bank of the river s the source of the accretion. The plaintiff con- ded that the land in question was an accretion to property but was subsequently cut off by avul- n. Of great persuasive value during the court's liberations was the physical evidence on the und and certain evidence demonstrating the wth pattern of timberlands. Also relying on vernment surveys, the court found that the river grated southward, destroying the south bank by sion. The result of the migration and erosion s the formation of the accretion on the north nk. On the basis of this analysis, the court de- ed in favor of the defendant and quieted title in n. YANT V CHICAGO MILL AND LUMBER CO IT TO QUIET TITLE TO ACCRETED PRO- RTY).

0 F Supp 463-478 (E D Ark 1954).

scriptors: *Arkansas, *Mississippi River, treams, *Accretion (Legal aspects), Boundaries roperty), Bank erosion, Riparian lands, Riparian hts, Proprietary powers, Prescriptive rights, mages, Remedies, Judicial decisions, Legal ects, Navigable rivers, Navigable waters.

intiffs brought suit to quiet title to accreted ds, claiming title thereto under a tax deed. The fendants asserted title to the land under various corded conveyances and by virtue of tax pay- nts made by themselves and their predecessors title. The court determined that the common decessor in title of both parties owned the lands question on both sides of the stream and had sold property on each side to separate persons. Each nveyance carried with it the accretions on the spective stream bank. Subsequent to the verance of the parcels from their respective accretions, a tax delinquency precipitated a tax sale of the mainland tract and its accretions. This property was purchased by plaintiffs at the sale. The court held that the plaintiffs were seized only of the mainland property and its accretions, finding that the severance of the parcels extinguished any rights the mainland tract owner might assert against accretions located to the east of the stream. THE DEVELOPMENT OF INTERNATIONAL WATER RESOURCES: THE 'DRAINAGE BASIN APPROACH',
C. B. Bourne.
The Canadian Bar Review, Vol 47, No 1, pp 62-87, March 1969. 26 p, 80 ref.

Descriptors: *Watersheds (Basins), *International law, *Water resources development, *River basins, Water utilization, Water policy, Planning, Basins, Drainage, Watersheds (Divides), Drainage effects, Watercourses (Legal), Water conservation, Water demand, Water resources, Diversion, Water law, Water allocation (Policy), Governments, Watershed management, Withdrawal, United Nations, Political aspects, International waters.

As the interdependence of co-basin states became clearer, it was recognized that international law required the development of the basin as a unit. Most authorities on international law acknowledge that unified development is desirable but deny that it is required by international law. Those who support the development of a drainage basin as a unit are influenced by the physical and economic unity of the basin. But the ability of modern technology to effect trans-basin diversions of waters has reduced the physical unity of many basins, and the development of efficient overland transportation has reduced their economic unity. Since the waters of a river may now serve a much larger population than that of its drainage basin, an approach which takes into account the most beneficial use of the water, whether inside or outside of its drainage basin, would make possible the most rational use of the waters. (Gabrielson-Fla)

PRIVATE LANDS AND WATERS, PUBLIC USE.
Minn Stat, secs 87.01 to 87.04 (1964).

Descriptors: *Minnesota, *Public health, *Public benefits, *Recreation facilities, Legislation, Recreation, Boating, Camping, Ice skating, Skiing, Water skiing, Fishing, Swimming, Water sports, Hunting, Land use, Parks, Recreation demand, Social aspects, Access routes, Roads, Waterway, Damages, Public rights.
Identifiers: Trespass.

State policy calls for the encouragement of the use of privately-owned lands and waters for public recreational facilities. Outdoor recreational use includes hunting, fishing, boating, swimming, skiing and other pursuits for the purpose of outdoor recreation. A free recreational area is a privately-owned area which the owner has made available to the public for recreational uses without compensation. The owner can make his land available by either executing a declaration stating his desire to do so, filed with the office of the register of deeds, or by posting notice on the land itself. No dedication of any land for recreational use shall take place except at the instance of the owner. No liability for damages to person or property occurring on a free recreational area shall lie against the owner except as could be maintained by a tresspasser. (Shevin-Fla)

PARMELE V EATON (SUIT TO DETERMINE NAVIGABILITY OF WATER COVERING PROPERTY SUBJECT OF PURCHASE).

240 NC 539, 83 SE 2d 93-99 (1954).

Descriptors: *North Carolina, *Coastal marshes, *Nonnavigable waters, *Beds, Swamps, Tidal marshes, Land reclamation, Shallow water, Guts, Tidal waters, Navigation, Boats, Commercial fishing, Legal aspects, Judicial decisions, Watercourses (Legal), High water mark, Navigable waters, Real property.
Identifiers: Marketable title, Contract of sale.

Plaintiff vendor sued defendant vendee for specific performance of a contract to sell certain real property. Plaintiff had tendered a deed and defendant had refused to accept it, alleging that title was unmarketable in that the land was covered by navigable waters and thus not subject to grant by the state or sale by the State Board of Education (plaintiff's predecessor in title). The appellate court, in affirming the trial court, ruled for plaintiff. The court felt that the evidence sustained the finding that the water covering this 2,000 acre tract of marsh land was not navigable. Ignoring the ebb and flow of the tide as criterion for determining navigability, the court felt the more practical test to be whether, in its ordinary state, a body of water has capacity and suitability for the usual purpose of navigation by vessels or boats such as employed in the ordinary course of water commerce, trade, and travel. The rule accepted by the court was that all watercourses are regarded as navigable in law which are navigable in fact. (Logan-Fla)

POTEETE V CITY OF WATER VALLEY (SUIT FOR DAMAGES RESULTING FROM DIVERSION OF SURFACE WATER).

42 So 2d 112-116 (Miss 1949).

Descriptors: *Mississippi, *Road construction, *Surface drainage, *Diversion, Surface runoff, Surface waters, Ditches, Drainage, Embankments, Levees, Cities, Local governments, Alteration of flow, Judicial decisions, Legal aspects, Relative rights.

Plaintiff landowners brought suit to recover for damages resulting from work done on an adjacent street. Plaintiffs contended this construction diverted the surface water from the street onto their residence lot. The trial court instructed the jury that it was plaintiffs' duty to do all in their power to mitigate damages, and, thus, they should recover no damages for those injuries which could have been prevented by ditching or levying. On appeal, the court declared this instruction to be invalid on two grounds: (1) the plaintiffs (abutting owners) had no legal right to go into the city's street and reopen the ditch or build a levee or embankment without defendant's consent; (2) defendant offered no evidence showing that plaintiffs could have avoided the damage by doing such work on his own property. Therefore, the case was reversed and remanded to the trial court. (Logan-Fla)

HUERTH V TOWN OF PRAIRIE DU SAC (ROAD CONSTRUCTION OBSTRUCTING SURFACE WATER FLOW).
252 Wis 102, 31 NW 2d 187-189 (1948).

Descriptors: *Wisconsin, *Surface drainage, *Road construction, *Natural flow, Roads, Culverts, Outlets, Drainage systems, Rivers, Hay, Crops, Floodwater, Overflow, Ditches, Conduits, Drainage engineering, Obstruction to flow, Surface runoff, Surface waters, Percolating water, Marshes, Local governments, Judicial decisions, Legal aspects.
Identifiers: *Residual flood waters, Seasonal floods.

LIBRARY U. OF I., URBANA-CHAMPAIGN

Plaintiff landowner brought suit against defendant town for damages resulting from town's failure to provide adequate drainage for surface and percolating waters in the construction of two roads intersecting near the corner of plaintiff's land. Plaintiff contended that this intersection forms a dyke which blocks the natural drainage of surface waters from his land in violation of statute. The issue was whether the flow obstructed was in fact a natural flow of drainage water. The court held that even though plaintiff had collected the surface and percolating waters into a drainage ditch, this ditch merely accelerated the movement of surface water in the direction of natural drainage. Obstruction of this ditch was therefore an illegal obstruction. The court further held that while a town does not have to provide for drainage through the path of seasonal flood waters, the statute does require them to provide for adequate drainage of residual flood waters in that these are considered to be surface waters. MACNEIL V CHICAGO PARK DISTRICTS (SUIT TO ENJOIN COLLECTION OF HARBOR FEES BY MUNICIPALITY).

401 Ill 556, 82 NE 2d 452-456 (1948).

Descriptors: *Illinois, *Harbors, *Navigable waters, *Local governments, Lake Michigan, Submerged Lands Act, Lake shores, Lagoons, Marinas, Beds, Boats, Ownership of beds, Parks, Legislation, State governments, Federal government, Judicial decisions, Legal aspects.
Identifiers: *Harbor fees, Delegation doctrine.

Plaintiff boat owner brought suit to enjoin the defendant Chicago Park District from collecting harbor fees for use of harbor facilities (docking, mooring, etc) on the grounds that harbors are public, navigable waters and, therefore, usable by members of the public free of charge. The court noted two primary issues: (1) whether the fee prescribed by the ordinance is an unconstitutional exercise of municipal authority over navigable waters; and (2) whether the state delegated such power to impose a fee to the Park District. As to the first issue, the court held this was neither an unconstitutional exercise of municipal authority over navigable waters nor an interference with interstate commerce. As to the second, the court found the Illinois statutes provided that submerged lands should be held for the purpose of constructing and maintaining lagoons and harbors for boats, and the establishing and maintaining of regulations for use thereof by the public. The court held this empowered the defendant to establish fees for the use of such special facilities. The court thus affirmed the dismissal of the complaint. (Logan-Fla)

SLAGLE V CITY OF EAST LIVERPOOL (SUIT FOR WASHOUT DAMAGES AND POLLUTION ABATEMENT).

86 NE 2d 37-39 (Ohio Ct App 1948).

Descriptors: *Ohio, *Washouts, *Dredging, *Pollution abatement, Water pollution, Public health, Stagnant water, Odor, Water pollution effects, Channel improvement, Natural streams, Running waters, Watercourses (Legal), Sewage, Obstruction to flow, Culverts, Pipes, Judicial decisions, Legal aspects.

Plaintiff landowners brought suit against defendant city to recover for damages resulting from defendant's dredging and deepening of a watercourse on plaintiffs' property and to abate a nuisance created by rubbish and debris being thrown into this natural watercourse, obstructing the flow and causing the water to become stagnant. It appeared from the evidence that defendant had gone ahead with the dredging of this open, natural watercourse without permission of plaintiffs and that this resulted in a $200.00 loss of land to plaintiffs. In regard to the alleged nuisance, the evidence showed heavy accumulation of waste material in the watercourse; the city was admittedly aware of this condition. The court affirmed the trial court's verdict for the plaintiffs. Concerning the nuisance, however, the court ruled that the trial court had the power to order abatement but not the power to prescribe the manner in which it was to be abated. (Logan-Fla)

UNITED STATES V MARTIN (TITLE TO LAND FILL).
177 F 2d 733-734 (D C Cir 1949).

Descriptors: *District of Columbia, *Riparian rights, *Landfills, *Boundaries (Property), Navigation, Relative rights, Ownership of beds, Riparian land, Accretion (Legal aspects), Federal government, Legislation, Rivers and Harbors Act, Bulkhead line, Piers, Docks, High water mark, Legal aspects, Judicial decisions.

The United States brought suit against certain landowners to establish its title to partially submerged land along the eastern branch of the Potomac River. Defendants are riparian owners who, by natural accretion and much artificial fill, have extended their land into the river beyond the original high water mark established in 1794. Since then, the government has established a bulkhead line some 300 feet beyond the high water mark. Some lots have now been filled up to the bulkhead line, and one wharf has been extended beyond it. The case turned upon ownership of land situated beyond the old high water mark. The court held that an owner of riparian land has the qualified right to make fills and to build wharves in the river, but the exercise of such right does not affect the power of the United States with regard to navigation. That is, the fill and wharf involved could be taken at any time without compensation in the interests of navigation, provided the taking was not arbitrary. (Logan-Fla)

STATE OF WISCONSIN V FEDERAL POWER COMMISSION (NAVIGABLE RIVERS).
214 F 2d 334-338 (7th Cir 1954).

Descriptors: *Wisconsin, *Navigable rivers, *Federal power act, *Federal-state water rights conflicts, Federal government, Navigable waters, Running waters, Streams, Lumbering, Supercritical flow, Administrative agencies, Interstate rivers, Mississippi River, Surface waters, Judicial decisions, Legal aspects.
Identifiers: Saw-log test.

The Federal Power Commission, in granting a project license to a power and light company, had ruled that a certain river was navigable. The Public Service Commission of Wisconsin brought suit to review this order contending that this river was not navigable in that no logs had been transported thereon since 1924. The court first took notice that prior to 1924 this river had been used extensively to transport logs from one state to another. The court held that under both state law (saw-log test of navigability) and federal law (streams suitable for use in the transportation of persons or property in interstate commerce) the east fork of the Chippewa River was navigable and subject to commission control. The fact that the river had not been used for the transportation of logs since 1924 was of no consequence. (Logan-Fla)

**GEIGER V CITY OF NEW YORK (DAMA
FROM STORM SEWER INSTALLATION).**

141 NYS 2d 667-670 (N Y Sup Ct 1955).

Descriptors: *New York, *Storm drains, *Drain
effects, *Road construction, Grading, Drainage
gineering, Sewers, Surface runoff, Surf
drainage, Surface waters, Paving, Graded, Nat
flow, Cities, Local governments, Legal aspects,
dicial decisions, Overflow, Damages.

Plaintiff property owners filed suit against the
to enjoin maintenance of an alleged nuisance
compel its abatement, and to recover damages.

t was precipitated by installation of a storm ver which required the street to be raised to a el above that of adjacent sidewalks. This caused ter to run off the street onto plaintiffs' property. e court, noting that the present grade was still ow the legal grade, reiterated the rule that when re is a change of grade, in the absence of gligence, the resulting damages to real property tting the newly graded street are damnum sque injuria in the absence of legislation horizing recovery for such damages. Finding no dence of negligence, the court dismissed the t. Furthermore, the court held that the city was der no duty to furnish drainage systems for water urally collected in the street and that a city can- be held liable for damage occasioned by the ural flow of surface water. (Logan-Fla)

THORN V BOARD OF COMMISSIONERS EVEE MAINTENANCE).

8 So 2d 335-341 (3rd C C A La 1969).

scriptors: *Louisiana, *Levees, *Flood protec- n, *Riparian land, Navigable rivers, Streams, yous, Appropriation, Flood control, Drainage tems, Public benefits, Overflow, Cattle, Legal ects, Judicial decisions, Riparian rights, Ad- nistrative agencies.
ntifiers: *Fences, *Levee servitude, Cattle rds, Injunctions (Prohibitory).

evee board adopted a resolution requiring lan- wners to remove fences along the levee crown ess cattle gates were installed. The landowners d to enjoin the levee board from enforcing the olution. The court noted that the public enjoyed ervitude for the making and repairing of levees land adjacent to navigable rivers and streams. arian lands are regarded as burdened with this vitude at the time they are severed from the blic domain. The landowners are regarded as ding subject to this servitude, and due process es not protect riparian owners from appropria- n or damage to their lands for levee purposes hout prior judicial proceedings. The actions of a blic agency in locating, building, and maintain- a levee are not subject to judicial review except the case of palpable abuse. The court cannot stitute its own judgment for that of the state's ee board which is responsible for protecting the blic from floods. The public's levee servitude is ited only by the reasonableness of its use. The rt held that it was not an unreasonable deter- nation by the board that the fences created an tacle to the performance of its duties and that levee board has a right to require landowners to ove their fences as obstacles to the main- ance of the levee. (Shevin-Fla)

ODWARD IRON CO V EARLEY (SUIT AINST MINE OPERATOR FOR LOSS OF LL WATER).

So 2d 267-270 (Ala 1946).

criptors: *Alabama, *Mining engineering, ater wells, *Water loss, Wells, Deep wells, Un- ground, Percolating water, Subsurface waters, colation, Mining, Coal mines, Shafts (Excava-), Damages, Leakage, Legal aspects, Judicial isions, Drainage.
ntifiers: 'Squeeze', Superjacent owner.

ntiff superjacent landowner brought suit inst defendant mining company alleging that ligence in the operation of a mine caused plain- s well to go dry. Plaintiff's testimony, as well as of expert witnesses, revealed that defendant's ing techniques, which included leaving an in- icient number of pillars within the mine, led to a eeze' which caused cracks to form towards the ace, draining water from adjacent wells. The rt stated that a mine operator is not liable for in- ntal damages (such as loss of a well by the su- acent owner) necessarily occasioned by the ordinary, careful operation of the mine in a manner not injurious to the surface. But, the court added, the issue of failure to exercise due care is a jury question and was therefore properly submitted to the triers of fact for determination. Furthermore, the evidence was sufficient to support a finding that defendant had in fact negligently operated the mine. But the court considered the lower court's award of $1200 damages as excessive and required remittitur. (Logan-Fla)

STATE V PINDER (ACTION TO REMOVE AN OBSTRUCTION FROM A DRAINAGE DITCH).

41 So 2d 479-485 (La Ct App 1949).

Descriptors: *Louisiana, *Surface drainage, *Relative rights, *Obstruction to flow, Surface waters, Surface runoff, Rainwater, Judicial decisions, Civil law, Natural flow, Drainage systems, Drainage water, Ditches, Drains, Controlled drainage, Drainage effects, Prescriptive rights, Riddance (Legal aspects), State governments, Local governments, Drainage engineering, Remedies.
Identifiers: Injunctions (Prohibitory).

Plaintiff brought this suit to have defendant enjoined from obstructing a drainage ditch. Plaintiff and defendant owned abutting lots; defendant's land was lower than plaintiff's. Over twenty years prior to this action, the city had constructed a drainage ditch across plaintiff's land and alongside defendant's property. Prior to the time when defendant became owner of the adjacent plot, plaintiff laid a pipe in the ditch crossing his land and covered the ditch over. The pipe ended eighteen inches from defendant's property. Plaintiff alleged that defendant had filled up the ditch on the side of his land and had placed an obstruction near the end of the drainage pipe which had caused water to back up on plaintiff's land. The court held that the defendant had wrongfully filled in the ditch. Since the ditch had been used for over ten years, it had become a continuous apparent servitude acquired by prescription. Defendant also acted wrongfully in obstructing the flow of water from the drainage pipe. The landowner whose waters flow naturally over another's land, may concentrate and increase the flow artificially provided he has drained only the water which normally flows across the other's land. Defendant could not impede the drainage onto his land without a showing that the drain added water to the natural quantity of water flowing across his land. (Kelly-Fla)

JONES V WALKER (ACTION TO ENJOIN MAINTENANCE OF AN EMBANKMENT).

44 So 2d 466-467 (Miss 1950).

Descriptors: *Mississippi, *Surface drainage, *Natural flow, *Alteration of flow, Storm runoff, Surface runoff, Relative rights, Judicial decisions, Surface waters, Rainwater, Rainfall-runoff relationships, Drainage engineering, Natural streams, Embankments, Flood damage, Drainage effects, Drainage systems, Remedies, Riddance (Legal aspects), Repulsion (Legal aspects), Flow augmentation, Diversion structures.
Identifiers: Injunctions (Prohibitory).

Plaintiff brought this suit to have defendant enjoined from maintaining a small embankment which caused water to flow into a natural stream. Plaintiff and defendant owned lands on opposite sides of a natural creek. In times of heavy rain, a natural hollow on defendant's land caused surface water to collect and overflow onto his cultivated fields. Defendant constructed an embankment on his land which caused waters in the hollow to flow into the creek instead of onto his land. Plaintiff contended that the embankment caused an excessive amount of water to flow into the creek so as to overflow plaintiff's land. The court held that since the embankment had the effect of causing the surface water to flow into the creek, a natural watercourse, and since it was not erected for the purpose of diverting a natural watercourse, it was a lawful protection of defendant's lands and plaintiff was not entitled to injunctive relief. Towns may construct public drains and sewers when such are deemed necessary for the public good. Public drains shall be maintained so as to provide suitable flow. If drains are not kept in repair, any person damaged by reason of such disrepair shall have an action against the town. Before land is taken for drains, notice shall be given and damages assessed and paid. The municipal officers may establish and collect service charges for the use of the system. Whoever wilfully or carelessly injures a public drain shall be liable for double

LIBRARY U. OF I., URBANA-CHAMPAIGN

damages. If a drain is to cross a railroad, unless a place for crossing can be determined by the town and railroad company, the public utilities commission shall choose an appropriate place. No one shall dig up a highway to lay a drain without consent of the town. Malfunctioning domestic sewage disposal units are to be considered a nuisance. An order to remedy a malfunctioning domestic unit may be sued upon by the landowner or occupant, and he shall have 10 days to remedy the defect. If the nuisance is not abated in 10 days, the municipal officers may enter upon the premises and remedy the malfunction. Any expenses of entry shall be recovered from the owner or by means of a tax assessed upon and collected in the next tax warrant. (Helwig-Fla)

JOHNSON V AGERBECK (SURFACE WATERS).
77 NW 2d 539-551 (Minn 1956).

Descriptors: *Minnesota, *Surface waters, *Reasonable use, Surface drainage, Surface runoff, Culverts, Ditches, Furrows, Drainage systems, Land use, Land forming, Agriculture, Judicial decisions, Legal aspects.
Identifiers: Injunctions.

The Minnesota Supreme Court reversed injunctive relief awarded by the lower court to plaintiff landowners in his action to compel defendants to fill up a ditch through which surface waters flowed onto plaintiffs' land. The court held that the evidence, particularly expert testimony on behalf of the defendants by engineers regarding land levels and height, did not support the lower court's finding that defendants had unreasonably caused surface waters to flow in increased volume onto plaintiffs' land. After defining surface waters, the court enunciated Minnesota's rule regarding reasonable use thereof: In making reasonable use of land for a legitimate purpose, a landowner may drain his land of surface waters and cast them upon adjacent land provided that he heeds existing circumstances, that there is a reasonable necessity for such drainage, that he takes reasonable care to avoid unnecessary injury to adjacent land, that utility or benefit accruing to his land reasonably outweighs harm resulting to burdened land, and that, where practicable, it is accomplished by reasonably improving the normal system of drainage according to its reasonable care and capacity. DELAWARE RIVER BASIN WATER COMM'N COMPACT.

N Y Unconsolidated Laws secs 1581, 1582, 1583, 1584 (McKinney Supp Dec 1968).

Descriptors: *New York, *Delaware River, *Interstate compacts, *Water resources development, New Jersey, Pennsylvania, Delaware River Basin Comm'n, Streams, Surface waters, State governments, Dams, Reservoirs, Impounded waters, Riparian rights, Riparian lands, Eminent domain, Condemnation, Legislation, Water conservation, Water demand, Water supply, Water distribution (Applied), Public benefits, Legal aspects, Competing uses.

The states of New Jersey, New York, and Pennsylvania, having a common interest in the waters of the Delaware River Basin, have entered into a compact. This compact is intended to facilitate the development, utilization, control and conservation of the water resources of the Delaware River. The states have agreed to create a joint advisory board known as the 'Delaware River Basin Water Commission'. The function of this commission is to formulate and recommend integrated programs for the development of the water resources of the Delaware River Basin. The Commission is to study the feasibility of the future construction of an integrated water supply system which would supply the water needs of all the signatory states. The Commission is responsible for providing an adequate minimum flow in the Delaware River and is required to provide an adequate supply of water for such purposes as navigation, flood control, and production of hydroelectric power. The Commission is empowered to effectuate the foregoing purposes through the acquisition of dams, reservoirs, and related facilities. The Delaware Basin constitutes all that land from which surface water drains naturally into the Delaware River. (Katz-Fla)

SEABOARD AIR LINE RR V SARASOTA-FRUITVILLE DRAINAGE DIST (LIABILITY OF DRAINAGE DIST FOR ITS TORTS).
255 F 2d 622-626 (5th Cir 1958).

Descriptors: *United States, *Drainage districts, *Railroads, *Contracts, Ditches, Culverts, Installation, Right of way, Drains, Administrative agencies, Taxes, Maintenance, Permits, Legal aspects, State governments, Florida.
Identifiers: *Public policy, Torts.

A railroad brought an action against a drainage district for damages from a train derailment allegedly caused by the lowering of ditches adjacent to the district's undertrack culverts causing the railroad's roadbed to give way. Plaintiff alleged that the defendant was liable under an agreement whereby defendant agreed to indemnify the railroad for damages growing out of the presence of culverts which plaintiff had permitted defendant to install beneath its tracks. The court stated that the sovereign cannot be sued without its consent. Furthermore, under Florida law, a statutory drainage district is not liable for its torts as the district can only levy taxes for the improvement and maintenance of the district. The court declared that since the district could not be liable by law in tort for its negligence, it should not be allowed to accept such liability as consideration for the acquisition of a valuable right. The court concluded that where a taxing unit such as defendant district obligates itself to use tax money in a way not authorized, this amounts to an illegal commitment to expend tax funds and is against public policy. Therefore, the indemnity agreement was void and plaintiff could not enforce it to recover damages. (Reed-Fla)

LOPEZ V SMITH (BOUNDARY DISPUTE).

109 So 2d 176-180 (Fla DCA 1959).

Descriptors: *Florida, *Boundary disputes, *Navigable rivers, Nonnavigable waters, Patents, Meanders, Tributaries, Tides, High water mark, Tidal waters, Water levels, Judicial decisions, Water law, Water rights, Streams, Legal aspects.
Identifiers: Suit to quiet title.

The Second District Court of Appeal of Florida reversed a chancellor's decree which dismissed appellants' complaint in an action to quiet title to certain islands bordering on a river and its branches. On appeal the court delineated the main issue between the respective parties as involving the location of the boundary lines of certain government lots. This issue, in turn, was dependent on two others: (1) whether the meander lines or the ordinary high water mark delineate the boundaries, and (2) whether all of the branches of the Little Manatee River are navigable. The court noted the general rule that a meander line is not a boundary and that generally the ordinary high water mark of lands located upon navigable waters delineates the boundary. The court also observed that the factor which determines navigability is the water's capacity for navigation, not its usage for that purpose and that navigable waters do not extend to all waters affected by tides which are not in fact capable of navigation for useful public purposes. Since the pleadings did not incontrovertibly establish navigability, the complaint was sufficient to withstand t motion to dismiss. (Carruthers-Fla)
W69-07331

TYSON V STATE OF IOWA (OWNERSHIP (ACCRETED LAND).

283 F 2d 802-811 (8th Cir 1960).

Descriptors: *Iowa, *Missouri River, *Nebrask *Accretion (Legal aspects), Federal governme Riparian land, Channel improvement, Condemn tion, Islands, State jurisdiction, River beds, Be under water, Boundary disputes, Owners of beds, Boundaries (Property), Riparian rights.

In an action by the United States to condemn la needed to stabilize the channel of the Misso River, there were conflicting claims as to own ship of the land. The court found Iowa law appli ble since the entire river bed was located in Io The court rejected the first defendant's claim sin under Iowa law, when a river moves over t owner's land, gradually destroying it, title to t shifting bed passes from the owner to the sta Islands subsequently forming on this bed likew belong to the state. The second claim established ownership of the lands in Nebraska the Nebraska bank of the river and claimed all land in controversy as accretions to his la Although both Iowa and Nebraska recognize right to acquire land by accretion, under Iowa l the riparian owner does not own the river bed the thread of the stream. The court found that land in controversy had formed as islands grow up from the river bed; thus, title was vested in state of Iowa. The state of Iowa was determined be the owner of all the land in controversy. (Kah Fla)

VALUES, ETHICS AND POLICY IN RELATION TO RESOURCE DEVELOPMENT AND CONSERVATION: A SELECTED BIBLIOGRAPHY,
Nevada Univ., Reno. Dept. of Philosophy.
Robert Roelofs.
Desert Research Institute, Water Resources Research Center, Preliminary First Edition, 18 pp, Apr 1968. 194 ref.

Descriptors: *Values, *Ethics, *Resource development, *Conservation, *Bibliographies, History, Resources, Ecology, Economics, Education, Natural resources, Environment.
Identifiers: *Public policy, *Environmental problems, Future studies, Science and technology, Philosophy.

There is a growing concern over environmental deterioration and adverse biological and psychological effects it may have on individuals and, eventually, on our social institutions and society as a whole. This bibliography is a preliminary attempt to organize books and articles dealing with problems concerning natural resources and natural environment with emphasis on social and humanistic concerns relating to the environment. This preliminary first edition contains 194 entries which are numered, classified, and cross-indexed under eleven topics. The topics and relative percentages of entries relating to each, are as follows: History, 5 percent; Resources, 10 percent; Conservation, 8 percent; Ecology, 5 percent; Economics, 7 percent; Public Policy, 19 percent; Future Studies, 6 percent; Science and Technology, 6 percent; Human Values, 23 percent; Philosophy, 6 percent; Education, 5 percent. Items included in the bibliography are chosen on their relevance to one or more of these topics from the viewpoint of social and personal values, and realization potential in light of realities of the environment. The author's stated purpose in compiling the bibliography is to furnish a guide to specialists involved in resource investigations, and concerned with the broader implications of their task; as well as social scientists and others involved in various aspects of environmental problems. MUNICIPAL WATER PROBLEMS - SOME LEGAL ASPECTS,
Thomas A. Matthews.
Current Municipal Problems, Vol 1, No 1, pp 8-16, August 1959. 8 p.

Descriptors: *Legal aspects, *Municipal water supply, Distribution, Water quality control, Financing, Irrigation, Jurisdiction, *Legislation, Institutional constraints, Public benefits, Public rights, Equitable apportionment, Supply contracts, Water transfer, Riparian rights.
Identifiers: Legislative aspects.

Where the source of water supply is distant from the area to be served, the legislature should grant authority to acquire and make use of a source of supply. Municipalities should also have the power to prevent contamination of the source. The legislature must resolve conflicts of interests between various municipalities and between agricultural and urban interests. There is a growing need for legislation to control and regulate the use of water from underground sources in order to insure proper distribution of the limited supply among those consumers needing it. Potential legal problems could arise from 'cloud seeding', weather modification, and controlled subterranean nuclear explosions to affect underground supply. Certain recommendations are made: (1) adequate means of financing, by revenue bonds or otherwise, must be made available, (2) statutes preventing pollution of water supplies, and (3) the legislature should allocate the right to use both underground and surface sources between municipal and agricultural uses, and between urban communities whose needs may conflict. NATIONAL WATER COMM'N.

Hearings on S 3107 Before the Senate Comm on Interior and insular Affairs, 89th Cong, 2nd Sess (1966).

Descriptors: *United States, *Water resources development, *Planning, *Water requirements, Legislation, Water allocation (Policy), Social aspects, Water utilization, Natural resources, Conservation, Economics, Water supply, Pollution, Water policy, Inter-basin transfers, Desalination, Water purification, Water reuse, Institutions, Water resources planning, Future planning (Projected), Legal aspects.
Identifiers: *National Water Comm'n, Senate Hearings.

A hearing was held before the Senate Committee on Interior and Insular Affairs on S 3107. This bill would create a national water commission which would: (1) review present and anticipated national water resource problems, project water requirements and identify alternative ways to meet these requirements--considering conservation, more efficient use of existing supplies, increased usability by reduction of pollution, innovations to encourage the highest economic use of water, inter-basin transfers, and technological advances such as desalting, waste water purification and reuse; (2) consider economic and social consequences of water resource development, including the impact of water resource development on regional economic growth, on institutional arrangements and on aesthetic values; and (3) advise on such specific water resource matters as may be referred to it by the President and the Water Resources Council. (Childs-Fla)

THE ATLANTIC STATES MARINE FISHERIES COMM'N.

Conn Gen Stat Ann secs 26-295 to 26-301 (1960).

Descriptors: *Connecticut, *Fisheries, *Fish conservation, *Interstate compacts, Legal aspects, Legislation, Regulation, Fish management, Wildlife conservation, Commercial fishing, Financing, Administrative agencies, State governments.
Identifiers: Atlantic State Marine Fisheries Comm'n.

The governor of Connecticut is empowered to execute a compact on behalf of the state in the Atlantic States Fisheries Commission. The Commission is open to all states on the Atlantic seaboard. The statute further goes on to recognize the compact in Connecticut and establish qualifications and powers of members to the Commission established by the compact. Provision is made for funds for the Commission as well as for accounting for receipts and disbursements by that body. (Johnson-Fla)

COMPACT FOR STATE MEMBERSHIP IN THE ATLANTIC STATES MARINE FISHERIES COMM'N.

Conn Gen Stat Ann sec 26-295 (1960).

Descriptors: *Connecticut, *Fisheries, *Fish conservation, *Interstate compacts, Legal aspects, Legislation, Regulation, Federal government,

LIBRARY U. OF I., URBANA-CHAMPAIGN

Water management (Applied), Fish management, Habitat improvement, Marine fish, Anadromous fish, Water conservation, Fish, Wildlife conservation, Commercial fishing, Financing, Administrative agencies, State governments.
Identifiers: Federal-state relations, Atlantic State Marine Fisheries Comm'n.

The compact's purpose is promotion of better utilization of Atlantic seaboard fisheries by development of a joint program for the promotion, protection, and conservation of such fisheries. The agreement becomes effective when any two or more Atlantic seaboard states join. Each member state will appoint three representatives to the Commission. One each will be selected from the appropriate department of the state's executive and legislative branches and one from the interested public. The duty of the Commission is to promote and bring about conservation of and prevention of depletion and physical waste of the fisheries, marine, shell and anadromous, of the Atlantic seaboard. The Commission may recommend coordination of the police powers of the several states, as well as suggest pertinent legislation. It may consult with appropriate administrative agencies of signatories. The Commission is further permitted to recommend stocking of waters and will be the coordinating agency for joint stocking. In cooperation with state agencies the federal fish and Wildlife Service of the Department of the Interior will act as research agency for the Commission. Annual appropriations in proportion to market value of fisheries products are established. (Johnson-Fla)

THE ATLANTIC STATES MARINE FISHERIES COMM'N (IMPLEMENTATION).

Conn Gen Stat Ann secs 26-296 to 26-301 (1960).

Descriptors: *Connecticut, *Fisheries, *Fish management, *Interstate compacts, Fish conservation, Legal aspects, Legislation, State governments, Administrative agencies, Financing, Commercial fishing, Marine fish, Anadromous fish, Fish management, Fish, Water management (Applied), Interstate commissions.
Identifiers: Atlantic States Marine Fisheries Comm'n.

Adoption of the compact creating the Commission as a joint regulatory agency with such powers as members may jointly confer upon it for the regulation of fishing operations in which members have a common interest is made. Commissioners from Connecticut will be: (1) chairman of the state board of fisheries and game, (2) a legislator and member of the Commission on intergovernmental cooperation of the state, and (3) a citizen with a knowledge and interest in the marine fisheries problem appointed by the governor. Term of office of the first two will correspond with their holding of public office. The latter's term will be three years. Powers in the compact are granted to the Commission. All officers of the state are directed to cooperate in carrying out the purposes of the compact. The Commission on intergovernmental cooperation will include in its budget necessary funds required by the Commission. The Commission will keep appropriate accounts of receipts and expenditures. (Johnson-Fla)

CHARACTERIZATION OF INTERSTATE ARRANGEMENTS: WHEN IS A COMPACT NOT A COMPACT,
David E. Engdahl.
Mich L Rev, Vol 64, No 1, pp 63-104, Nov 1965. 42 p, 212 ref.

Descriptors: *Interstate compacts, *Interstate rivers, *International law, *State governments, Political aspects, Legal aspects, Boundary disputes, Public health, Conservation, Judicial decisions, Federal government, Safety.
Identifiers: *Constitutional law.

Formal interstate arrangements dealing with governmental problems affecting more than one state have become increasingly common in recent years. These 'compacts' generally deal with coordinated programs to promote conservation, health, safety, and similar matters such as interstate canals, bridges, and settlement of boundary water disputes. The question often arises whether such arrangements come within Article I, section 10 of The United States Constitution, which forbids entry by any state into a treaty, alliance, or confederation, and requires congressional consent for any agreement or compact with another state or foreign power. A study in semantics reveals that federal and state courts have erred in assuming all such agreements come within the constitutional provision. Although congressional assent may be sought to secure federal assistance or political gains, it is required by the Constitution only in case of 'dispositive' arrangements such as those apportioning interstate waters--not in the vast majority of 'cooperative' arrangements. The courts should review past decisions in light of the practical need for freedom among the states to cooperate so long as such cooperation does not preempt federal authority. (Harris-Fla)

HALL V WANTZ (PUBLIC EASEMENT OF NAVIGATION TO RIPARIAN RIGHTS).

336 Mich 112, 57 NS2d 462-465 (1953).

Descriptors: *Michigan, *Public rights, *Competing uses, Riparian rights, Lakes, Lake shores, Judicial decisions, Navigation, Navigable waters, Public benefits, Relative rights, Riparian land, Recreation, Reasonable use, Fishing, Water law, Easements, Great Lakes, Inland waterways.
Identifiers: *Subaqueous lands, White Lake, Anchorage, Injunctions (Permanent).

Plaintiffs appealed from a lower court ruling dismissing plaintiffs' bill of complaint for a perpetual injunction restraining defendant from mooring his fishing raft along the shore of plaintiffs' properties fronting on Michigan's White Lake. The Supreme Court of Michigan granted a permanent injunction restraining defendant from anchoring his 40 foot floating raft, from which defendant permits persons to fish for a fee, in front of plaintiffs' shoreline. The court reviewed Michigan's laws regarding the rights of the public and riparian owners to use of navigable inland waterways and concluded that while a riparian owner's property rights to subaqueous lands are subject to an easement in the public for general recreation and navigation purposes, nevertheless the right of navigation does not include the right to anchor indefinitely off the riparian owner's premises, particularly when it is attended with consequent impairment of the riparian owner's use and enjoyment of his property rights. (Carruthers-Fla)

iff brought suit to quiet title to an island in the ssippi River, alleging payment of taxes on said or fifteen years under color of title. Defen- asserted that the area described in the com- was formed from accretions to their island. argued that, because they had paid taxes on iginal land, they had necessarily paid taxes on ccretions and therefore, were entitled to be red owners of the accretions. The court ed out that title to land carries with it all tions formed thereto, whether or not men- l in the formal instrument of conveyance. The declared that in order for land to constitute and in a river, such land must be permanently unded by a river channel at all river water . The court was of the opinion that the nce established that the area in controversy sented accretions to defendants' island, and he testimony showed that plaintiff's land had washed away and never reappeared. Further- the court rejected plaintiff's claim of adverse ssion because the land described in the assess- books on which plaintiff paid taxes was the which had disappeared not the land formed by tion. controversy over the location of wharfing plaintiff requested an injunction requiring dants to remove a pier and piles, alleging that encroached on her riparian area. The dispute because the dry-land boundaries between the ctive riparian lots did not run at right angles to ver. Plaintiff claimed that the riparian boun- were projections of their lot lines. The dis- court found that the pier and piles did not en- croach upon plaintiff's riparian area and dismissed the complaint. It found that riparian boundaries were projections of lot lines to the bulkhead line and from there ran at right angles to the bulkhead line. Both parties appealed. The court affirmed dismissal of the complaint, holding that an encroachment could not be shown since the riparian boundaries had not yet been fixed. The court stated that these boundaries should be fixed so as to balance the conflicting interests of neighboring riparian owners and of the public, with due regard for existing structures. Since the setting off of such boundaries is work for special officials familiar with the demands of navigation and wharfing, the district court was unqualified to attempt to establish such boundaries. PEART V STATE (PAYMENT FOR LAND APPROPRIATED FOR HIGHWAY).

125 So 2d 673-682 (Ct App La 1961).

Descriptors: *Louisiana, *Highway relocation, *Riparian land, *Compensation, Levees, Highways, Judicial decisions, Public benefits, Navigable rivers, Legislation, Riparian rights, Damages, Condemnation, Right-of-way, Eminent domain, Easements, Condemnation value, Legal aspects.
Identifiers: Servitude.

Plaintiff brought suit to obtain payment for land appropriated to relocate a highway more than 200 feet from a new levee on the Red River. Plaintiff's land was located between the levee and the highway. The Department of Highways claimed no compensation was due. A civil code statute imposed servitudes upon lands of riparian owners on navigable rivers for the making and repairing of levees, roads and other public works. The court held that the statute had been interpreted to impose a servitude only when the public purpose was incident to the nature, navigable character, or use of the stream. Here the original highway and the relocated highway were intended only as thoroughfares for traffic between two cities. Likewise, a second statute providing that an owner bound to give a public road must furnish a second without compensation where the first is destroyed or impassable was inapplicable, since plaintiff was not bound to give the original road unless used incident to the navigable character of the stream. Plaintiffs were awarded compensation for the right-of-way and severance damages. (Kahle-Fla)

UNITED STATES V STATES OF LOUISIANA, TEXAS, MISSISSIPPI, ALABAMA AND FLORIDA (OWNERSHIP OF LANDS UNDERLYING GULF OF MEXICO).

364 U S 502, 81 S Ct 258-259 (1960).

Descriptors: *United States, *Gulf of Mexico, *Boundary disputes, *Ownership of beds, Louisiana, Texas, Mississippi, Alabama, Florida, Beds, Beds under water, Mineralogy, Boundaries (Surfaces), Coasts, Continental shelf, Judicial decisions, Legal aspects.
Identifiers: Coast line.

By the terms of a final decree in an action by the United States against Louisiana, Texas, Mississippi, Alabama, and Florida for a declaration of ownership of land, minerals and other natural resources underlying the Gulf of Mexico, the United States was entitled to land and minerals underlying the Gulf of Mexico more than three miles seaward from the coast lines of Louisiana, Mississippi and Alabama, and more than three leagues seaward from the coast lines of Texas and Florida, and extending to the edge of the continental shelf. None of the states or their assigns were entitled to any interest or use of said lands and minerals. As against the United States, the defendant states were entitled to land and minerals from their coast lines to the point where United States ownership vests as outlined above. The court defined 'coast line' as the line of ordinary low water along that portion of coast which is in direct contact with the sea and the line marking the seaward limit of inland waters. Defendant states were to promptly render to the United States all sums of money derived by such state since June 5, 1950, either by sale, leasing, licensing, exploitation or otherwise on account of any of the lands or resources lying beyond their limits of ownership. (Kahle-Fla)
W69-07651

PROTECTION OF NAVIGABLE WATERS - OBSTRUCTION OF NAVIGABLE WATERS AND THE ESTABLISHMENT OF HARBOR LINES.

33 USCA sec 403, 404, 405 (1957).

Descriptors: *Piers, *Federal government, *Legislation, *Navigable waters, Breakwaters, Bulkheads, Jetties, Harbors, Canals, Navigation, Excavation, Alteration of flow, Federal jurisdiction, Federal-state water rights conflicts, Water resources development, Navigable rivers.
Identifiers: Corps of Engineers, Secretary of the Army, Harbor lines.

Where he deems it necessary the Secretary of the Army is authorized to establish harbor lines, beyond which no piers, wharves, bulkheads, or other works may be extended or deposits made except under such regulations as he may prescribe. Unless authorized by Congress, the creation of any obstruction to the navigable capacity of any of the waters of the United States is prohibited. It is unlawful to build any wharf, breakwater, or other structure in any port, canal, navigable river, or other body of water outside established harbor lines, or where no harbor lines have been established, except on plans recommended by the Chief of Engineers and authorized by the Secretary of the Army. It is also unlawful to excavate or fill, or in any manner modify the course, condition or capacity of any port, roadstead, haven, harbor, canal, lake, harbor of refuge, or inclosure within the limits of any breakwater, or of the channel of any navigable water of the United States, unless the work has been authorized by the above officials. The above provisions are made specifically applicable to the Potomac and Anacostia Rivers. (Smith-Fla)

INJURY TO HARBOR OR RIVER IMPROVEMENTS.

33 USCA secs 408, 409 (1957).

Descriptors: *Legislation, *United States, *Federal government, *Navigable waters, Harbors, Bays, Obstruction to flow, Bridges, Dams, Streams, Permits, Regulation, Transportation, Coastal structures, Seawalls, Check structures, Jetties, Retaining walls, Navigable rivers, Channels, Docks, Piers, Engineering structures, Legal aspects.

It is unlawful for any person to use or take possession of any coastal structure erected by the United States to improve or preserve navigable waters or to prevent floods. It is unlawful to obstruct navigable channels by improper anchorage or by voluntarily sinking or causing to sink a craft within such a channel. It is unlawful, except as otherwise provided, to float loose timber and logs in a navigable channel or to float sack rafts therein. The owner of a craft sunken in a navigable channel must immediately mark such craft with a buoy and light. Such owner shall immediately take action to remove the craft. Failure to act will be taken to indicate that the vessel has been abandoned and the United States will then remove the craft. (Katz-Fla)

PROTECTION OF NAVIGABLE WATERS - SUMMARY REMOVAL OF WATER CRAFT OBSTRUCTING NAVIGATION.
33 USCA sec 415 (1957).

Descriptors: *Navigation, *Federal government, *Legislation, *Navigable waters, Bays, Canals, Locks, Rivers, Lakes, Federal jurisdiction, Federal-state water rights conflicts, Water resources development, Navigable rivers, Boats, Eminent domain.
Identifiers: Sunken watercraft, Obstruction to navigation, Secretary of the Army.

LIBRARY U. OF I., URBANA-CHAMPAIGN

In an emergency, any vessel, raft, or similar obstruction which is sinking or grounding, or being unnecessarily delayed in any Government canal or lock, or in any navigable waters, in such a manner as to stop, seriously interfere with, or endanger navigation, in the opinion of the Secretary of the Army or any agent to whom he may delegate proper authority, the Secretary or such agent shall have the right to take immediate possession of such boat or raft and remove or destroy it so as to clear the waters of the obstruction. The agent charged with the removal or destruction of an obstruction may in his discretion give notice in writing to the owners of any such obstruction requiring them to remove it. The expense of removing the obstruction shall be a charge against such craft and cargo, and if the owners fail or refuse to reimburse the United States for such expense within thirty days after notification, the agent may sell the craft or cargo, or any part thereof that may not have been destroyed, and the proceeds of such sale shall become the property of the United States government. ANDERSON V STATE (NON-RESIDENTS NOT ENTITLED TO COMMERCIAL FISHING LICENSE).

213 SW 2d 615-617 (Ark 1948).

Descriptors: *Arkansas, *Commercial fishing, *State jurisdiction, Beds, Fishing, Fish management, Judicial decisions, Legislation, Water resources, Water users, Wildlife management, Permits, Regulation, Ownership of beds.
Identifiers: Constitutional rights.

Defendants, non-residents of Arkansas, were arrested for illegally engaging in commercial fishing contrary to state law which prohibited the issuance of a commercial fishing license to any person who had not resided in the state at least 6 months. Defendants had obtained non-resident fishing licenses. The court held that the statute did not violate due process or discriminate against non-residents, since the state owns the beds of all waters within its jurisdiction and may appropriate their use to its citizens for the taking of fish. Such a right is a property right and not a mere privilege or immunity of citizenship that must be extended to non-residents nor is it a regulation of commerce. (Kahle-Fla)

6G. Ecologic Impact of Water Development

POND ECOLOGY AND WATERFOWL PRODUCTION IN RELATION TO OPTIMUM WATER RESOURCES UTILIZATION IN THE TURTLE MOUNTAINS OF NORTH DAKOTA,
North Dakota State Univ., Fargo. Dept. of Zoology.
J. Frank Cassel, and Robert E. Stewart, Jr.
Research Project Technical Completion Report to Office of Water Resources Research, Department of the Interior, April 1969. 50 p, 14 fig, 11 tab, 20 ref.

Descriptors: *Animal populations, *Ducks (Wild), *Ecology, *Water chemistry, *Wetlands, American Widgeon, Blue-Winged Teal, Broods Bufflehead Duck, Canvasback Duck, Common Goldeneyed Duck, Gadwall Duck, Green-Winged Teal, Lesser Scaup Duch, Mallard Duck, migratory birds, Pintail Ducks, Puddle Ducks, Redhead Duck, Ring-Neck Duck, Ruddy Duck, Shoveler Duck.

During drought years of 1967 and 1968, 60 quarter sections, including 206 wetlands, were studied in the Turtle Mountains of North Dakota. Waterfowl surveys were made, and wetlands were classified and sampled for water chemistry. Due to drought conditions, acreages of wetlands decreased progressively. Some wetlands were more abundant during the two years; cover types varied. Water chemistry determinations indicated a graphical relationship between wetland subclasses and specific conductance. Fifteen species of waterfowl were found in the area the most common of which were mallard, blue-winged teal, ring-necked duck, lesser scaup, redhead, and canvasback. Total waterfowl population estimates varied from 3768 plus or minus 1937 in 1967 to 3179 plus or minus 966 in 1968. Significant conclusions concerning dabbling ducks and diving ducks include: A decrease in spring densities was noted for most species from 1967 to 1968. Most species, except blue-winged teal, produced fewer broods in 1968 than in 1967. Average brood size for the most common species decreased in 1968. Dabbling ducks gathered in small mobile flocks during June, 1968. Diving ducks formed large mobile flocks during early and late June, 1968. Most ducks gave no indication of breeding activity other than maintenance of some pair bonds. Hatch peaks tended to be later in 1968. A large influx of dabbling ducks into the Turtle Mountains was recorded in June of 1968.

THE ORGANIZATION AND ANALYTICAL PROCEDURES REQUIRED BY A LARGE ECOLOGICAL SYSTEMS STUDY,
California Univ., Berkeley. Dept. of Entomology and Parasitology.
Ronald W. Stark.
Systems Analysis in Ecology, K E F Watt (ed), Academic Press, New York, pp 37-68, 1966. 7 fig, 3 tab, 49 ref.

Descriptors: *Ecosystems, *Systems analysis, *Analytical techniques, *Planning, Insect control, Pine trees, Sampling, Aerial photography, Computers, Research and development.
Identifiers: *Computer analysis, Beetles, Dendroctonus brevicomis.

A description is given of the organization and analytical procedures developed in studying the ecology of western pine beetles, Dendroctonus brevicomis. The objective was to learn how to predict the course of population buildups in order to control their destruction of ponderosa pine forests. 26 scientists from 10 academic, government, and industry departments were involved. A study of the geographic distribution of the beetle and its hosts was made, including seasonal variations. Up to the time of this report work has dealt with the elaboration of sampling procedures for the study of complex systems, in this case involving geography, season, infested trees, and insects within the trees, all with computer analysis capability in mind. Aerial photography for the analysis of populations of infested trees and X-ray techniques for analysis of insects within trees are found to be more efficient and economical than visual observation and bark dissection procedures. Proc, Nat Symp Anal Water-Resource Syst, pp 167-190, Denver, July 1-3, 1968. 28 p, 3 fig, 11 ref.

Descriptors: *Network design, *Simulation analysis, *Optimization, *Digital computers, Distribution systems, Mathematical models, Cost analysis, Water supply, Analytical techniques, Data processing.
Identifiers: Method of feasible directions, Gradient method.

Systematic methods of solving distribution network design problems using simulation and optimization techniques were presented. Non-linear models were constructed. Simulation, gradient, and 'methods of feasible directions' techniques were used. Data processing systems were used for the evaluation of network designs and for aiding parametric studies by improving the speed, accuracy and data handling characteristics of simulation problems optimizing network designs. The design of computing systems and the synthesis of the problems were discussed and plans for introducing optimization into simulation in the future were discussed. For main entry see W69-07562. 7B. Data Acquisition

POSSIBILITIES FOR REMOTE DETECTION OF WATER IN ARID AND SUBARID LANDS DERIVED FROM SATELLITE MEASUREMENTS IN THE ATMOSPHERIC WINDOW 3.5-4.2 mu,
National Aeronautics and Space Administration, Greenbelt, Md. Goddard Space Flight Center.
Jean Pouquet.
International Conference on Arid Lands in a Changing World, Arizona University, Tucson, June 3-13, 1969. 17 p, 9 fig, 11 ref.

Descriptors: *Remote sensing, *Arid lands, *Subsurface waters, Soil water, Soil moisture, Soil temperature, Groundwater, Exploration, Hydrography, Mapping, Water resources development, Water supply, Aerial photography, Satellite (Artificial), Infrared radiation.

The purpose of this work was to survey water resources and assess agricultural possibilities in arid and subarid lands. Detection was either of subsurface water through its direct thermal effect or the soil moisture storage capacity. Daytime infrared radiations were almost useless because the scanned areas were too large; the eastern temperatures were too high, the western too low. But, nighttime infrared values proved most useful. (Soil moisture moves toward the cooler profile, at night the cool surface. It carries stored daytime warmth with it to the surface). Most useful were grid print maps of ground equivalent black body temperatures derived from Nimbus radiometer measurements in the 3.5-4.2 mu range. Several examples from Africa and North America are presented. By locating areas appearing warmer than they should be, preselection of promising areas for field exploration was made, which from the ground could take years. It is speculated that infrared sensing will become one of the principle media used for the systematic survey of arid land resources. (Sherbrooke-Ariz)
W69-07356

A GEOMETRIC METHOD TO SUBDIVIDE THE PATAPSCO FORMATION OF SOUTHERN MARYLAND INTO INFORMAL MAPPING UNITS FOR HYDROGEOLOGIC USE,
Maryland Geological Survey, Baltimore.
Harry J. Hansen.
Geol Soc Amer Bull, Vol 80, No 2, pp 329-336, Feb 1969. 8 p, 5 fig, 23 ref.

Descriptors: *Stratigraphy, *Coastal plains, *Aquifers, *Maryland, Hydrologic data, Mapping, Geologic mapping, Cross-sections, Transmissivity, Sands.
Identifiers: Patapsco Formation (Maryland).

The Patapsco Formation of southern Maryland is a thick, heterogeneous sequence of unconsolidated rocks occurring in the upper part of the Potomac Group. Experience suggests that it functions as a multi-aquifer unit of hydraulic complexity. In the absence of definitive geologic criteria an adaptation of Haites' (1963) technique of perspective correlation is used to subdivide the Patapsco Formation into consistently defined mapping units. These units are useful for delineating vertical and horizontal changes in such parameters as sand percentage and coefficient of transmissibility. (Knapp-USGS)

PIEZOMETER DETECTION OF SATURATED INTERFLOW IN SOILS,
Tennessee Valley Authority, Knoxville.
Roger P. Betson, John B. Marius, and Robert T. Joyce.
Soil Science Society of America Proceedings, Vol 32, No 4, pp 602-604, July-August 1968. 2 p, 1 fig, 1 tab, 3 ref.

Descriptors: *Piezometers, Instrumentation, Soil water, *Saturated flow, Watershed hydrology.

Piezometers were used as saturated interflow detection devices in a study of partial watershed contribution to storm runoff. Saturated interflow was detected along the AB-horizon interface in clay loam soils with shallow A horizons. The results of the study showed that at least under some soil conditions piezometers can be useful in determining the extent of saturated flow within a watershed. The occurrence of this flow will normally be confined to the shallow A-horizon regions.
W69-07463

A TECHNIQUE TO INFER ATMOSPHERIC WATER-VAPOR MIXING RATIO FROM MEASURED HORIZON RADIANCE PROFILES,
National Aeronautics and Space Administration, Langley Station, Va. Langley Research Center.
Thomas B. McKee, Ruth I. Whitman, and Jules J. Lambiotte, Jr.
NASA Tech Note D-5252, June 1969. 33 p, 7 fig, 5 tab, 12 ref.

Descriptors: *Meteorology, *Atmospheric physics, Air masses, Atmospheric pressure, Humidity, Solar radiation, Temperature, Weather data.
Identifiers: *Horizon radiance profiles, *Atmospheric water-vapor mixing ratio.

A technique is presented to infer atmospheric water-vapor mixing-ratio structure from measured horizon radiance profiles when a method exists for calculating radiance profiles. Inferred mixing-ratio accuracy for the 10-km to 35-km altitude range is shown when the computer program input data contain no errors and when the computer program input is perturbed by errors normally found in measurements. Water-vapor mixing ratios are inferred from horizon radiance profiles measured in the summer in an altitude range from 17 deg to 58 deg from NASA Project scanner flight. No significant altitudinal variation existed above an altitude of 18 km. Below 18 km an altitudinal variation does exist that is consistent with the large variations that are known to exist in the troposphere. The mixing ratio decreases with altitude to a minimum at a ranging from 3 km to 5 km above the tropo altitude. Above an altitude of 20 km the ratio shows a slight increase to 35 km. (

Descriptors: *Recession curves, *Base *Streamflow forecasting, Hydrographs, levels, Groundwater movement, Runoff, S groundwater relationships.
Identifiers: Stream recession, River USK (U.

A statistical method of analyzing and fore river recession curves within 3 days after the tion of rain is presented. The principle und the method is to isolate the rate of recession relate this by regression analysis to para which physically are known to affect the recession. River discharge (implicitly a mea groundwater levels), antecedent condition season were used. Other more objective p ters could be used. The basis for the met completely munerical, and any recession cu be analyzed automatically from a set of rainf runoff data by either a computer or a trained All subjectivity has been removed from the a except in the choice of parameters believed fect rate of recession. This article discusses the application of POH-106 program for the calculation of mean annual and monthly precipitations on the basis of Thiessen's method and using the charts COH-102 of total rain gage data. This program is considerably more complete than the POH-104 program utilizing the daily precipitation values and is, in reality, a method of substitution by using rain gage observations. The application of the method, however, is conditioned by the lengths of distance intervals between the rain gage stations. (Gabriel-USGS)

LARGE RIVER DAMS (FRENCH),
Rhone National Co. (France).
Marc Henry.
Travaux, Vol 52, No 409, pp 191-197, Apr 1969. 7 p, 3 fig.

Descriptors: *Dams, *Streamflow, *Reservoirs, Floods, Solid wastes, Sediment discharge, Water circulation, Velocity, Dam sites, Embankments, Equipment, Alluvium.
Identifiers: Large river dam.

This article presents pertinent engineering and hydrological considerations for proper construction of dams across large rivers. The article contains the following brief chapters; (1) raising the water levels in the upper reaches; (2) elimination of water circulation sediments. (3) particular characteristics of river dams; (4) water-gate types; and (5) dams built on alluvium foundations. (Gabriel-USGS)

RUBBLE MOUND BREAKWATER BEHAVIOR UNDER WAVE ACTION (FRENCH),
Electricite de France. Dept. of Studies and Research.
Adelkis J. Rogan.
Elec De France, Bull de Dir Etud et Rech, Ser A, Suppl No 1, 1968. 153 p, 31 fig, 11 tab, 1 photo, 65 ref, 4 append.

Descriptors: *Breakwaters, *Dams, *Water (Water), Construction, Stability, Mathematical models, Model studies, Equilibrium, Deterioration, Statistical methods, Stochastic processes, Frequency, Probability, Reynolds number, Floods, Water levels, Density, Viscosity, Talus.
Identifiers: Wave action-jetty behavior.

The study is a monograph on the behavior of jetties under the wave action of regular swells and irregular wind waves. After giving a critical review of several classical and standard formulas, the author develops simple formulas based on the use of the continuity equation, Navier-Stokes equations and introducing the 'wave-action-time' paramcter. These modified formulas were applied to a series of model tests using a flume and a paddle producing swells during which the height of waves (H), their period (T), and destruction time (t) of the breakwater model were recorded. Another series of experiments was conducted by using a flume with removable cover and a fan. The study shows that the destructive wave height is very closely equal to the significant height H, used in many countries as the design wave height. In general, certain strength limits can be evaluated for the structures with the aid of the 'destruction-risk criterion' defined in the model tests and statistical analysis of wave recordings at a proposed jetty site. (Gabriel-USGS)

DESIGN OF SEWER SYSTEMS,
Colorado State Univ., Fort Collins.
Mell Holland.
Proc, Nat Symp Anal Water-Resource Syst, pp 218-224, July 1-3, 1968. 7 p, 4 fig, 4 ref.

Descriptors: *Sewers, *Design flow, *Pipes, *Optimization, *Linear programming, Sanitary engineering, Constraints, Hydraulics, Network design.
Identifiers: *Tree network, *Looped network.

Linear programming solutions to the problem of optimal design of a sewer system were presented. The objective was to minimize the total cost of materials and placement. Linear programming techniques were used to determine the optimal layout design. Three alternative approaches to the design of sewer systems were considered. The first was the current approach based on a selected layout for which a tentative set of pipe sizes and slopes was chosen on the basis of engineering experience and judgment. This approach did not include an explicit optimization. The second approach was a two-phased approach in which the layout selection and sthe specifications for the pipe sizes and slopes were optimized in separate steps. The selection of the layout was found to be the more difficult of the two phases. The third and optimal alternative included the simultaneous optimization of the layout, the pipes and the slopes. There was no procedure available for this approach. For main entry see W69-07562. (Thiuri-Cornell)

POTENTIAL ECONOMIC BENEFITS FROM THE USE OF RADIOISOTOPES IN FLOW MEASUREMENTS THROUGH HIGH-HEAD TURBINES AND PUMPS,
Bureau of Reclamation, Denver, Colo. Div. of Project Investigations.
Edmund Barbour.
Bur Reclam Eng Monogr No 38, 1969. 25 p, 6 fig, 5 tab.

Descriptors: *Pumps, *Hydraulic turbines, *Flow measurement, *Tracers, *Radioisotopes, Pump testing, Hydraulics, Performance, Hydraulic equipment, Instrumentation, Tracking techniques, Pipe flow, Flowmeters.

LIBRARY U. OF I., URBANA-CHAMPAIGN

Identifiers: *Conduit flow metering.

The uses of radioisotopes to measure flow of fluids through high-pressure turbines and pumps is summarized as part of a program for the development of simple, accurate, inexpensive flow-measurement systems. Other methods are briefly reviewed. Of the 11.6 million kw capacity in Bureau of Reclamation powerplants, 3 million kw are considered amenable to radioisotope flow measurements. If the method makes operation 1/2% nearer to potential efficiency, a gain of $2 million in 10 yrs is possible. Pumps are more difficult to test. Of 1.7 million hp, about 1 million may be tested by radioisotope methods, yielding as much as 1% greater efficiency at a saving of $1.3 million in 10 yrs. Good flow rate measurement will also allow improved equipment design with large savings. (Knapp-USGS)

Identifiers: Nontidal waters, Seasons (Fishing), Shad.

The lines separating tidal and nontidal waters within the state are described. Fish ladders must be built when dams are placed across streams. Preventing fish from having free access up and down streams is unlawful. Dynamiting streams is illegal. The Game and Inland Fish Commission has jurisdiction to establish regulations concerning fishing in nontidal waters. Seasons for all fish are presently year long. All persons fishing for trout in designated trout streams must purchase a trout stamp in addition to their regular fishing license. Fishing at night in trout streams and taking shad by means other than angling are prohibited. There are a number of other general restrictions on fishing in nontidal waters. Fishing on private ponds stocked by the owner is illegal. Persons who raise game fish must purchase an annual permit. A license is necessary for operation of a pond where fishing is permitted on payment of a fee. The commission t

SELECTED WATER RESOURCES ABSTRACTS

LIBRARY U. OF I. URBANA-CHAMPAIGN

TWRI
1033

VOLUME 2, NUMBER 19
OCTOBER 1, 1969

W69-07700 -- W69-08126

Selected Water Resources Abstracts is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the Clearinghouse for Federal Scientific and Technical Information (CFSTI) of the Bureau of Standards, U. S. Department of Commerce. It is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U. S. Department of the Interior, Washington, D. C. 20240. Annual subscription is $22.00 (domestic), $27.50 (foreign), single copy price is $3.00. Certain documents abstracted in this journal can be purchased from the Clearinghouse at the prices indicated in the entry. Prepayment is required.

LIBRARY U. OF I. URBANA-CHAMPAIGN

VOLUME 2, NUMBER 19
OCTOBER 1, 1969

W69-07700 -- W69-08126

Use of funds for printing this publication approved by the Director of the Bureau of the Budget, September 4, 1968.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources. WRSIC is not presently prepared to furnish loan or retention copies of the publications announced.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas. Centers, and their subject coverage, now in operation are:

- Ground and surface water hydrology at the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources management at the Center for Urban Studies of the University of Chicago.

LIBRARY U. OF I., URBANA-CHAMPAIGN

- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Research Institute of Rutgers University.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin, jointly sponsored by the FWPCA, Soap and Detergent Association, and the Agricultural Research Service.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.

In cooperation with the Federal Water Pollution Control Administration, the following "centers of competence" have been established:

- Thermal pollution at the Department of Sanitary and Water Resources Engineering of Vanderbilt University.
- Textile wastes pollution at the School of Textiles of North Carolina State University.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

LIBRARY U. OF I., URBANA-CHAMPAIGN

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

DVANCES IN HYDROSCIENCE.

how, Ven Te, Editor. Advances in Hydroscience, ol 5, 1969. 305 p, 127 fig, 18 tab, 383 ref, 2 in-ex.

escriptors: *Reviews, *Bibliographies, *Ground-ater movement, *Stochastic processes, *Snow, eepage, Infiltration, Snowpacks, Mathematical odels, Model studies, Mathematical studies, Soil ysics, Open channels.
lentifiers: Stochastic hydrology, Snow physics.

ecent advances in stochastic hydrology, subsur-ce flow, and snow physics are reviewed. tochastic hydrology helps in the design of water esource systems by use of analytical or simulation odels. Mathematical and physical work in open-annel seepage and in soil water movement per-its good water conveyance design work and sub-rface water determinations. Recent work in snow hysics includes study of metamorphism, diffusion, apor transport, and radiation properties. See also /69-07724 thru W69-07727. (Knapp-USGS)

escriptors: *Analog computers, *Analog models, Model studies, *Hydrograph analysis, Floods, ainfall-runoff relationships, Hydraulic models, arametric hydrology, Mathematical models, outing, Flood routing.
lentifiers: Flood hydrographs.

o analyze the time element of flood hydrographs surface runoff, use is made of a single-purpose ectronic resistance-capacitance computer con-ining 6 RC units with a non-linearity element. he time lag constants of the computer are selected n the basis of measured time lags from a physical aled model of an experimental watershed on hich the floods are simulated by a sprinkler. The sulting hydrographs from the analog computer id the physical model are compared at various in-nsities and durations of rain. The study is directed ward an interconnection of the analog computer id the physical model. (Knapp-USGS)

WATERSHED SIMULATION BY ELECTRONIC ANALOG COMPUTER,
Utah Water Research Lab., Logan.
J. Paul Riley, Duane Chadwick, and Eugene Israelsen.
Symp on Use of Analog and Digital Computers in Hydrol, Tucson, Ariz, Dec 1968, Int Ass Sci Hydrol, Pub No 80, Vol 1, pp 25-37, 1968. 13 p, 9 fig, 11 ref.

Descriptors: *Analog models, *River basin development, Water demand, Water supply, Hydrographs, Hydrograph analysis, Streamflow, Streamflow forecasting, Rainfall-runoff relationships, Resistance networks, Simulation analysis.
Identifiers: Watershed simulation.

At Utah State University the consequences of man-made hydrologic changes in drainage basins are being approached by electronic analog simulation. A model is developed for investigating the behavior or response of a dynamic prototype system subject to particular constraints and input functions. Simulation permits an examination of the composite system involving all processes occurring simultaneously. Thus, a model is not only an excellent exploratory tool, but also a direct aid to creative thinking. A model can greatly facilitate an appraisal of proposed changes within a prototype system. A fundamental requirement of a computer model of a physical system is that it simulate on a continuous basis all important processes and relationships within the system that it represents. The various functions and operations of the different parts of the system are interrelated by the concepts of continuity of mass and momentum. Many of the processes which occur in hydrologic systems can be represented by time-dependent differential equations. For the solution of this equation form, the analog computer is particularly adept because it can integrate problem variables on a continuous basis. Close agreement with observed outflow hydrographs has been achieved in several model experiments. Analog computer simulation seems capable of making substantial contributions both in the area of basic water related research, and also as a planning and management technique in seeking optimum use of existing water supplies. (Knapp-USGS)

ELECTROLYTIC TANK TYPE MODELS FOR PREDICTING THE POSITION OF THE GROUNDWATER TABLE AND THE LOSS OF RIVER DISCHARGES,
Research Inst. for Water Resources Development, Budapest (Hungary).
E. Varrok.
Symp on Use of Analog and Digital Computers in Hydrol, Tucson, Ariz, Dec 1968, pp 3-9, 1968. Int Ass Sci Hydrol, Pub No 80, Vol 1, pp 3-9, 1968. 7 p, 8 fig.

Descriptors: *Analog models, *Surface-groundwater relationships, Induced infiltration, Bank storage, Dams, Aquifers, Reservoirs, Resistance networks, Electrolytes, Model studies.
Identifiers: Hungary, Danube River, Resistivity models, Electrolytic analog models.

Groundwater levels on riverside areas may be predicted by electrolytic tank models and automatic devices. On the 73 km long stretch of the Danube River between river stations 1795 and 1868 km, hydroelectric development has been contemplated. Here the river flows on the ridge of an alluvial deposit, and influences the water table on both sides. On the right side an area of about 800 sq km is influenced. The gravel aquifer overlying the impermeable bottom is from 50 to 300 m deep. The area was reproduced in an electrolyte type model to 1:25,000 scale, with the bottom relief made of synthetic resin. The slope of the water surface in the rivers bordering and crossing the area, and also the anisotropy of the aquifer were taken into consideration. This model was used to predict the position of water table, its depth under the terrain, the discharge filtering into the draining canals and the total seepage loss from the river. For models of this type automatic equipment has been developed to find the preselected equipotential lines and follow them automatically, tracing their path on an adjacent drawing board to the scale of the model. (Knapp-USGS)

DIGITAL COMPUTER SOLUTIONS FOR FLOOD HYDROGRAPH PREDICTION FROM RAINFALL DATA,
Technische Hochschule, Munich (West Germany).
Hydraulics Research Station Obernach.
Gert A. Schultz.
Symp on Use of Analog and Digital Computers in Hydrol, Tucson, Ariz, Dec 1968, Int Ass Sci Hydrol, Pub No 80, Vol 1, pp 125-137, 1968. 13 p, 9 fig, 3 tab, 11 ref.

Descriptors: *Mathematical models, *Computer models, *Digital computers, *Rainfall-runoff relationships, *Flood forecasting, Synthetic hydrology, Hydrographs, River forecasting, Rainfall disposition, Computer programs, Unit hydrographs.
Identifiers: Germany, Hydrograph synthesis.

A linear distributed-system model for flood hydrograph synthesis was applied to 2 characteristic test catchments (up to 700 sq mi in area) in central Europe, one of which was an Alpine watershed. The method uses very small elements, both in time and space, which made the use of a digital computer inevitable. The calculations were performed by a Telefunken TR 4 computer (80,000 operations/sec) using an ALGOL code program. The mathematical model uses as input information rainfall data consisting of temporal and spatial distribution and catchment characteristics. The output consists of a digital flood method in which the hydrological deviation between the observed and the synthesized hydrograph is calculated. The 30 synthesized floods were compared with the results gained by applying the conventional Unit Hydrograph method (also calculated by an ALGOL-code computer program) to the same floods. The results show that the new model produces a higher average accuracy than the conventional Unitgraph method. Furthermore it was possible to show that the accuracy of the model in contrast to the Unitgraph method, did not deteriorate with increasing catchment area. (Knapp-USGS)

DETERMINATION OF THE RUNOFF HYDROGRAPH ON A DETERMINISTIC BASIS USING A DIGITAL COMPUTER,
Technical Univ. of Budapest (Hungary).
M. Kozak.
Symp on Use of Analog and Digital Computers in Hydrol, Tucson, Ariz, Dec 1968, Int Ass Sci Hydrol, Pub no 80, Vol 1, pp 138-151, 1968. 14 p, 8 fig, 10 ref.

Descriptors: *Rainfall-runoff relationships, *Mathematical models, *Computer models, *Digital computers, Computer programs, Synthetic hydrology, Rainfall disposition, Rainfall intensity, Hydrographs, Hydrograph analysis.
Identifiers: Hungary.

The two main prerequisites for the exact determination of runoff discharge from catchments are the knowledge of the linear charge and the computation of resulting flow conditions in the canal network with due allowance for the non-steady character of flow. The catchment area is divided first into catchment strips and these in turn into fields having homogeneous parameters. For deriving a solution for the problem the equation expressing the mean velocity of sheet flow is included. The linear charge is obtained as the combined effect of runoff originating from catchment fields situated successively downstream. Allowance for the main parameters of each field--which vary with respect to location and time alike and affect runoff conditions--is made by the division into fields. Allowance can also be made for variations of rainfall intensity in both time and space. For solving the resulting differential equation a mathematical program has been compiled, and its application is illustrated by a representative example. From the results of mechanical computation it could be concluded that essential, but hitherto not clearly understood features of the involved hydraulic phenomenon, are revealed in greater detail by computations relying on more exact theoretical foundations. (Knapp-USGS)

APPLICATION OF THE HYDRAULIC ANALOGY TO FIELD AMPLIFIER DESIGN (FRENCH),
Department of Sciences, Toulouse (France).
J. Dat, and C. Fonade.
La Houille Blanche, Vol 24, No 1, pp 35-43, 1969. 9 p, 5 fig, 16 ref.

Descriptors: *Analog models, *Mathematical studies, *Mathematical models, Hydraulic design, Fluid mechanics, Runoff, Channels, Compressible flow, Pressure, Stokes law, Temperature, Energy equation, Viscous flow, Velocity, Heat flow.
Identifiers: *Hydraulic analogy design.

The application of the hydraulic analogy to hydrological problems was investigated on the basis of the solution of 6 equations: (1) continuity; (2) Navier and Stokes' 3 equations of motion; (3) conservation of energy; and (4) pressure-volume-temperature equation. The study shows that, by neglecting fluid viscosity, the polyotropic index (the ratio of specific heat at constant pressure to specific heat at constant volume) is 2. The study also shows that by assuming geometrical similarity there is an analogy between the depth of water in a free-surface model and the density of the fluid under pressure. The last conclusion is equivalent to setting the pressure flow Mach number equal to the Froude number for free-surface flow. An example given in the article indicates that this analogy can be achieved in practice. (Gabriel-USGS)

FUNCTION SPACE APPROACH TO PARAMETER IDENTIFICATION IN DISTRIBUTED SYSTEMS,
Hitachi Research Lab., Ibaraki (Japan); and California Univ., Los Angeles.
Yukio Kawamoto, and Jacques J. Vidal.
Water Resources Res Center Publication (undated). 4 p, 1 fig, 3 ref. OWRR Project No A-032-CAL.

Descriptors: *Mathematical models, *Digital computers, *Analytical techniques, *Computer programs, Data processing, Synthetic hydrology, Numerical analysis, Parametric hydrology, Simulation analysis.
Identifiers: Partial differential equations.

The solution of partial differential equations describing realistic physical problems can place a heavy burden on even the largest and fastest computers. Moreover, if the problem is one of synthesis such as parameter identification, repeated solving of the equations are called for, rendering the computing outlook even more critical. This is especially true if the parameter values at each node are considered independent elements of a multivariable system. The alternate approach discussed here reduces the problem to one of optimal control in function space. A compact algorithm is derived to identify parameters that are distributed functions by iterative updating over the whole space and time domains. (Knapp-USGS)

TROPICAL RAINFALL VARIATIONS OVER A SMALL AREA,
University Coll., Dar-es-Salaam (Tanzania). Dept. of Geography.
I. J. Jackson.
J Hydrol, Vol 8, No 1, pp 99-110, May 1969. 11 p, 2 fig, 3 tab, 5 ref.

Descriptors: *Rainfall, *Rainfall disposition, Rain gages, Sampling, Statistical methods, Regression analysis, Tropic, Climatic zones, Humid climates, Storms.
Identifiers: Tanzania.

The large spatial variation of daily and monthly rainfall over an area of about 2 sq mi is analyzed. The variation is the result of storm tracks rather than relief. Little difference was found in the assessment by 3 different methods of mean depth of rainfall over the area. The 10 rain gages used were found to be barely adequate for an accurate estimation of mean depth. (Knapp-USGS)

THE EFFECT OF CASPIAN SEA LEVEL OSCILLATIONS ON EVAPORATION INTENSITY FROM ITS SURFACE (RUSSIAN),
R. L. Reyfman.
Izv Acad Nauk, Azerboydzhanskoy, SSR, No 5, pp 121-127, 1968. 7 p, 1 fig, 9 ref.

Descriptors: *Evaporation, *Evaporation control, *Sea level, Water balance, Water loss, Water supply, Runoff, Hydrologic properties, Mathematical models, Humidity, Wind velocity, Ice, Freezing, Temperature.
Identifiers: *Caspian Sea, Surface evaporation.

Caspian Sea surface evaporation was investigated on the basis of earlier publications and application of the V.S. Samoylenko evaporation formula (1963), by connecting an evaporation layer in mm, mean monthly air-vapor pressure deficit in mbar, and mean wind velocity in m/sec. On the basis of the analysis of the available material and assuming some probable evaporation changes for various levels of the Caspian Sea, a schematic map of probable evaporation values was constructed for a two-meter decrease of the Caspian Sea level. The study shows that under present conditions of measurement accuracy a 2-3 meter decrease in the Caspian Sea level would not affect the volume of evaporated water over the Caspian Sea surface. HYDROLOGIC ANALYSIS FOR LAKE ONTARIO: STOCHASTIC ASPECTS OF EVAPORATION.
Cornell Univ., Ithaca. School of Civil Engineering.

Research Project Technical Completion Report No 12, of the Water Resources and Marine Sciences Center, June, 1969. 75 p, 12 tab, 15 fig, 52 ref. OWRR Project A-009-NY.

Descriptors: *Stochastic processes, *Evaporation, Mass transfer, Model studies, Hydrologic budget, *Lake Ontario, Hydrologic cycle, Water balance.
Identifiers: *Lake hydrology.

Before a complete analysis can be made of Lake Ontario as a hydrologic system, a sufficiently accurate estimate must be available of the evaporation component of the hydrologic cycle. Therefore, monthly mean values of evaporation from Lake Ontario for the period 1872-1965 were generated by a mass-transfer procedure. Available on-shore recorded meteorological data were adjusted to obtain approximate over-lake values. The mass-transfer coefficient was calculated with an equation by Harbeck (1962) relating it with water surface area. Correlation and spectral analyses showed that the annual cycle was predominating in the evaporation--and in the related meteorological time series. Evaporation is usually high in fall and winter and low in spring and summer. A warming trend was observed in the air temperature and a drying trend in the relative humidity series. Cross correlation and cross spectral analyses showed a close relationship between evaporation anomalies and the related meteorological parameters. A first order Markov model described adequately the evaporation, air temperature and relative humidity anomalies whereas a second order model could fit the wind speed and water surface temperature anomalies. Comparison of the mass-transfer evaporation data with Morton's (1967) water-budget estimates revealed that on the average the two methods are comparable. The water-budget method yields higher evaporation estimates in the summer and lower estimates in the winter.

ON THE HIGH REYNOLDS NUMBER FLOW OVER A WAVY BOUNDARY,
California Univ., San Diego, La Jolla. Inst. of Geophysics and Planetary Physics.
Russ E. Davis.
J Fluid Mech, Vol 36, Part 2, pp 337-346, Apr 14, 1969. Contract No Nonr-2216 (29)-ONR, Grant No GA-849-NSF.

Descriptors: *Waves (Water), *Viscous flow, *Turbulent flow, *Fluid mechanics, Reynolds number, Laminar flow, Interfaces, Shear, Viscosity, Roughness (Hydraulic).
Identifiers: Shear flow, Rayleigh number.

The nature of a shear flow over a wavy boundary of small amplitude is investigated. It is found that if the viscosity is small, the nature of the flow is highly dependent on the wave amplitude. If the wave amplitude is truly infinitesimal, the flow is described by the Orr-Sommerfeld equation and in the neighbourhood of the critical layer viscous stresses are important even in the limit of vanishing viscosity. However, if the wave is sufficiently large, viscous stresses may be neglected even in the critical layer. An approximate solution of the inviscid equations of motion is obtained to describe the flow over a small but finite wave in the limit of infinite Reynolds number. (Knapp-USGS)

CHANGES IN THE CHANNEL MORPHOLOGY OF TRINITY RIVER AND EIGHT TRIBUTARIES IN CALIFORNIA, 1961-65,
Geological Survey, Menlo Park, Calif.
John R. Ritter.
Geol Surv Open-file Rep, Aug 1, 1968. 60 p, 27 fig, 9 tab, 17 ref.

Descriptors: *Channel morphology, *Alluvial channels, *California, Banks, Streamflow, Sediment load, Beds, Channel erosion, Discharge (Water), Regime, Shape, Sands, Gravels.
Identifiers: *Trinity River (Calif).

Most of the changes from 1961 to 1965 in the channel morphology of a 40-mile reach of the Trinity River in California were caused by the devastating flood of Christmas week, 1964, and perhaps to a lesser extent by the regulation of flow from Lewiston and Trinity Dams. The magnitudes of the changes in the Channel were recorded by means of repeated surveys of cross sections of the river located near the mouths of 8 tributaries. The greatest changes occurred near the mouths of North Fork Trinity River and Canyon Creek which were the farthest downstream of the 8 tributaries. Banks were eroded laterally as much as 140 ft and as much as 11 ft of deposition occurred in some areas. As the bed of the Trinity River is composed mostly of cobbles and pebbles, the maximum size of bed material moved during the flood was at least cobble and probably boulder. Erosion of the bed occurred at almost every section. The maximum recorded erosion of the thalweg was 1.7 ft; the maximum aggradation, 4.7 ft. Except for 1 section, the pool and riffle pattern indicated by the cross sections remained the same for 1961-65. At eroded locations the bed material became coarser; at aggraded locations, finer. vers), Upper Colorado River.

anges in the hydrologic equilibrium of a river
in resulting from resource development bring
ut changes in the quality pattern as well. It is
portant to be able to predict what the resulting
lity changes might be from any contemplated
elopment at any specified location within the
r system. An electronic analog computer was
d for simulating the water and salt flows of the
per Colorado River basin. To calculate the rela-
nship between salt flow and water flow, a
drologic model is based on historical water
dgeting utilizing almost all available data of
er flows, municipal and industrial uses, and the
demands from agriculture. Where data or records are not available the trial and error capabilities of the analog, one of the most vital assets of the analog because of the ease and quickness in producing a solution, were utilized to obtain the most reasonable estimate of the lacking variable. The salt flow is added to the water flow system utilizing historic measurements of salt concentration. The salt concentration is characterized by a volume flow of salt coupled with the volume flow of water. Because of the integration capability of the analog computer the solutions obtained are on a continuous basis. Such information might be used in allocating the cost of damages to the pollutor resulting from the increase of salinity. The economics of water pollution could thus be evaluated at any point in the Upper Colorado River basin. (Knapp-USGS)

HYDROLOGIC REGIONS IN BULGARIA (BULGARIAN),
Iv Marinov, and T. Panajotov.
Hidrologija i meteorologija, Vol 16, no 6, pp 41-51, 1967. 11 p, 4 fig, 4 ref.

Descriptors: *Hydrologic aspects, *Climatic zones, *River basins, Precipitation (Atmospheric), Runoff, Snowmelt, Surface-groundwater relationships, Low flow.
Identifiers: *Bulgaria, Hydrologic regions, Mesta River, Struma River, Black Sea.

Regularities in precipitation and runoff permit division of Bulgaria into two regions: one influenced by the European continental climate, and the other by the continental and Mediterranean climate. Almost all of north Bulgaria and the western half of south Bulgaria comprise the first region where about 65% of the runoff occurs in the Feb-June period. In the second region, comprising the eastern half of south Bulgaria, a narrow strip of the northern Black Sea coast and parts of the Struma and Mesta River valleys, 65% of the annual runoff is in the Nov-Mar period. Three kinds of inflow are described: snowmelt and rainfall, snow, and rainfall; phases of the runoff are an index also, as is subterranean feeding. The river basins can be put into three groups: those with stable runoff, moderately stable and unstable runoff. (Gabriel-USGS)

Identifiers: *European USSR, Volga River, Orodezh basin, Belomorsko-Kuloiskoye plateau, Onega-Severnaya Dvina.

The karstic effects upon the runoff of small rivers within the northern and central zones of the European part of the USSR were investigated on the basis of some detailed field work and permanent stream gaging station data observed during several years. The study shows that the application of the analogy method for hydrologic designs and, in particular, the use of ordinary small-scale maps of runoff should be strictly limited to indisputable cases of proven natural similarity. Schematic maps should be drawn of summer and winter runoffs associated with the approximate evaluation of water resources. It is recommended also to establish a relationship between streamflow and the level of underground waters feeding the rivers. The article discusses karstic influence on surface water in the following areas: (1) runoff in the Oredezh river basin; (2) streamflow in the Belomorsk-Kuloysk plateau; (3) streamflow in the Onaga-Dvina area; and (4) streamflow in the middle Volga region. CHANNEL CAPACITY AND THE ADJUSTMENT OF STREAMS TO HYDROLOGIC REGIME,
Liverpool Univ. (England). Dept. of Geography.
A. M. Harvey.
J Hydrol, Vol 8, No 1, pp 82-98, May 1969. 17 p, 7 fig, 1 tab, 21 ref.

Descriptors: *Streamflow, *Alluvial channels, *Channel morphology, *Stage-discharge relations, Flow characteristics, Duration curves, Depth-area-duration analysis.
Identifiers: Flood recurrence intervals, Flood frequency.

Previous work on the frequency of bankfull discharge on alluvial streams in a variety of environments suggests a recurrence interval for bankfull conditions of somewhere between 1 and 3 yr. In 3 streams in southern England chosen for study, seventy-one cross sections were surveyed in the field and their discharge capacities determined. Variations in the frequency of bankfull were found both between the streams and along each stream. Flood regime stream-segments appear to exhibit adjustment to the 1-2 yr flood but with less frequent flooding downstream. Baseflow streams appear to be adjusted to rarer floods and the Wallop Brook exhibits an increase in flood frequency downstream. Two factors are suggested to explain these differences; the frequency of competent discharges and the duration of floods of a given frequency. The channels are seen to represent a balance between erosion and deposition influenced by the magnitude, frequency and duration of high discharges, but those of the baseflow streams appear to be more susceptible to short term changes by aggradation in response to subtle environmental variations. Symp on Use of Analog and Digital Computers in Hydrol, Tucson, Ariz, Dec 1968, Int Ass Sci Hydrol, Pub No 80, Vol 1, pp 59-66, 1968. 8 p, 4 fig, 2 ref.

Descriptors: *Analog models, *Water-level fluctuations, *Groundwater basins, Artesian wells, Aquifers, Resistance networks, Forecasting, Water management (Applied), Discharge (Water), Recharge, Pumping.
Identifiers: USSR, Moscow Basin (USSR).

The application of electrical network models for a long-term prediction of the dynamics of falling groundwater heads as a result of intensive development in the central part of the Moscow artesian basin is discussed. The optimum regime of water sampling, the prospective areas for additional water sampling and the most appropriate pattern distribution of new water supply wells were calculated. To take into account the natural hydrogeological conditions of a great territory, use may be made of an electronic analogue computer. The pattern of an electrical model of the studied gion of the basin has been improved by solving a ries of reverse problems under the stationary non-stationary conditions. The natural and ar cial factors, which determine the nature and rat groundwater declines in the period of observat in the basin, were reproduced. To solve the reve problems and make predictions, a single-laye and a multi-layered pattern were modeled. (Kna USGS)

GROUND WATER IN ONTONAGON COUN MICHIGAN,
Geological Survey, Lansing, Mich.
C. J. Doonan, and G. E. Hendrickson.
Mich State Geol Surv Water Invest Rep No 9, M 1969. 29 p, 5 fig, 1 plate, 4 ref.

Descriptors: *Water resources, *Groundwa *Michigan, Water wells, Hydrologic data, Data c lections, Water quality, Aquifers, Water lev Water yield.
Identifiers: Ontonagon County (Mich).

Most wells in Ontonagon County, Michigan obtain water from glacial lake beds or from bedrock. Deposits of glacial till and outwash also yield water to domestic wells in a few parts of the county. The lake beds supply enough water for domestic use to many wells, but more than half of the wells in the county are drilled into bedrock to obtain a satisfactory supply. Wells yielding large supplies of several hundred gallons per minute are unknown in this county. Water from most wells is hard to very hard, and many wells yield water that contains objectionable amounts of iron. Water from the deeper wells in bedrock, especially near Lake Superior, is generally too salty for domestic use. (Knapp-USGS)

ELECTRICAL-ANALOG ANALYSIS OF THE HYDROLOGIC SYSTEM IN TUCSON BASIN, ARIZONA, U.S.A.,
Geological Survey, Tucson, Ariz.
T. W. Anderson.
Symp on Use of Analog and Digital Computers in Hydrol, Tucson, Ariz, Dec 1968, Int Ass Sci Hydrol, Pub No 80, Vol 1, pp 15-24, 1968. 10 p, 5 fig.

Descriptors: *Model studies, *Analog models, *Groundwater basins, *Arizona, Water levels, Water-level fluctuations, Pumping, Water wells, Aquifers, Forecasting, Water demand, Planning, Water yield, Recharge.
Identifiers: Tucson Basin (Ariz).

The water supply for the area in the Tucson basin, Arizona, is derived entirely from groundwater, and pumpage has caused water-level declines of as much as 60 ft. An electrical-analog model of the hydrologic system in the Tucson basin area was constructed to provide a hydrologic tool for determining the effects of possible groundwater management schemes. Periodic water-level data, pumpage, and transmissibility constants were compiled to allow the construction of the primary model. Preliminary analyses of the model showed where additional data or modifications in model design were needed. The final design, the most precise representation of the actual data was used to predict groundwater levels in 1985, assuming that pumpage is stabilized at the present rate and distribution. (Knapp-USGS)

NEW APPROACH SUGGESTED FOR DESIGN OF ELECTRICAL ANALOG COMPUTERS FOR GROUNDWATER FLOW STUDIES,
Tata Inst. of Fundamental Research, Bombay (India).
P. Kumaraswamy.
Symp on Use of Analog and Digital Computers in Hydrol, Tucson, Ariz, Dec 1968, Int Ass Sci Hydrol, Pub No 80, Vol 1, pp 95-100, 1968. 6 p, 9 ref.

Descriptors: *Analog models, *Aquifers, *Groundwater movement, Pumping, Water wells, Water levels, Water level fluctuations, Water management (Applied).
Identifiers: India.

The usual electrical analog computer used for groundwater studies consists of an analog model simulating the aquifer by an array of discrete resistors and capacitors representing a scaled version of the hydraulic resistance and storage properties. Invariably it is economically impossible to gather sufficient field data to truly assess the aquifer characteristics and hence to build a true analog. To obviate the above difficulty, a new approach of design of the computing device is suggested. Only pumping rates and water levels and the history of their variations in space and time as well as the depths and locations of all wells are used. A liquid medium (continuous resistance in lieu of discrete resistors) should be selected and wells will be simulated by conducting rods of suitable dimensions and penetrations into the electrolyte. By utilizing suitable servos, all the observed potential changes and current changes in the analog will simulate synchronously the water level and flow changes in the aquifer. Such a computer will simulate the aquifer at every moment, as and when the excitation-response pairs are transduced into electrical quantities and telemetrically injected into the analog. HARDNESS OF GROUND WATERS IN BULGARIA (BULGARIAN),
Toso M. Kehajov.
In Jubileen geologiceski sbornik (Anniversary geological collection), Sofia, Bulgavskaya Akademiya Nauk, pp 447-455, 1968. 10 p, 4 fig, 5 tab, 9 ref.

Descriptors: *Aquifers, *Hardness (Water), *Water chemistry, Chemical analysis, Calcium, Carbonates, Mountains, Manganese, Chlorides, Sulfates, Mapping.
Identifiers: *Bulgaria.

Mineral characteristics of Bulgarian groundwaters are examined using earlier publications and recent studies by the author. The average water mineralization ranges from 0.2 to 1.2 g/l. Low mineralized hydrocarbonate-calcium waters are associated with the high mountain areas and waters of higher mineral content are found in the plains and coastal areas. Groundwater in the plains and coastal areas is of the calcium-magnesium and sulphate-chloride type. A map is presented giving the distribution of groundwaters in Bulgaria based upon the following criteria: very soft (Ca and Mg less than 1.5 mg eq), soft (1.5-3.0 mg eq), medium hard (3.0-4.5 mg eq), fairly hard (4.5-6.0 mg eq), hard (6.0-9.0 mg eq), and very hard (greater than 9 mg eq). DETERMINATION OF HYDROGEOLOGICAL PARAMETERS BY PUMPING TESTS IN WATER TABLE AQUIFER (BULGARIAN),
Il. G. Jotov.
In Jubileen geologiceski sbornik, (Anniversary Geological Collection), Sofia, Bulgavskaya Akademiya Nauk, pp 457-465, 1968. 9 p, 2 fig, 2 tab, 6 ref.

Descriptors: *Hydrologic properties, *Aquifers, *Water table, *Pumping, Theis equation, Mathematical studies, Parametric hydrology, Wells, Hydraulics, Analytical techniques.
Identifiers: *Hydrogeological parameters, Pumping tests.

An analytical method is developed for determination of the formation characteristics in unconfined aquifers (water table conditions). The analysis is made on the basis of solving flow equations in which specific yield is variable in time (Boutlon's equation). Data are recorded at two observation wells and parameters are evaluated by using the Theis method. Comparison is made between drawdowns obtained at variable and at constant specific yields. It is concluded that the method used reduces considerably the duration of pumping tests. A numerical example is given to illustrate the method. (Gabriel-USGS)

CONFINED FRESH WATER AQUIFERS IN LIMESTONE EXPLOITED IN NORTH MEXICO WITH DEEP WELLS BELOW SEA LEVEL,
Office of Hydraulic Resources (Mexico).
Heinz Lesser Jones.
Hydrol of Fractured Rocks Vol 2, Proc Dubrovnik Symp (Oct 1965), Int Ass Sci Hydrol, Pub 74, pp 526-539, 1967. 14 p, 9 fig.

Descriptors: *Groundwater, *Hydrologic properties, *Limestones, Water wells, Geologic control, Water yield, Artesian wells, Transmissivity, Drawdown, Sea level, Mesozoic era, Groundwater recharge, Storage capacity, Rainfall, Geomorphology, Pleistocene epoch, Geophysics, Electrical well logging.
Identifiers: *Mexico, Eastern Sierra Madre Range.

Fresh water aquifers in limestone formations of the Eastern Sierra Madre, Mexico, are described on the basis of geological, hydrological, and electrical well-logging data. The limestones are very persistent and pervious, of total thickness of about 1,000 m, and contain in some areas aquifers of considerable productivity. Several cities in northern Mexico obtain their water supply from the limestones. About 50 wells of depths varying from 200 to 1,400 m and elevations varying from 1 to 800 m below sea level have been developed by these cities. The confined limestone aquifers are under artesian pressure. Well yields of 40 to 240 liters per second and drawdown of 2 to 40 m have been recorded. Water levels vary from 20 to 80 m seasonally. Transmissibilities and storage capacities are extremely high. Recharge from the isolated rains that occur within the aquifer outcrops is nearly instantaneous. (Gabriel-USGS)

WATER FLOW IN THE FLORIDAN LIMESTONE AQUIFER, USA,
Geological Survey, Washington, D. C.
Bruce B. Hanshaw, William Back, and Meyer Rubin.
Hydrol of Fractured Rocks Vol 2, Proc Dubrovnik Symp (Oct 1965), Int Ass Sci Hydrol, Pub 74, pp 601-614, 1967. 14 p, 8 fig, 2 tab, 10 ref.

Descriptors: *Groundwater movement, *Aquifers, *Limestones, *Chemical reactions, *Florida, Equilibrium, Carbon, Dolomite, Radioactivity, Radioactive dating, Sulfates, Calcium carbonate, Water properties, Water quality, Groundwater recharge, Groundwater, Tertiary, Geology, Hydrogeology, Magnesium.

The application of geochemical principles to a reasonably well known hydrologic environment is applied for determining the solid phases which control the chemistry of water moving through an aquifer system. Major recharge to the Floridan aquifer, consisting of a series of limestones of Tertiary age and some dolomite, occurs in both high and low areas of the piezometric surface. Principal areas of recharge in the aquifer are marked by low total dissolved solids, low sulfate and magnesium content, and high C-14 concentrations (low apparent ages). Because C-14 concentration decreases in a systematic manner, apparent groundwater velocities may be reliably calculated. The article contains among others, the following topics: chemical character of the water: radiocarbon concentrations; and mineral equilibrium. (Gabriel-USGS)
W69-07985

UNCONFINED AQUIFERS AND THE CONCEPT OF THE SPECIFIC YIELD,
Agricultural Research Council, Cambridge (England). Unit of Soil Physics.
E. G. Youngs.
Bull Int Ass Sci Hydrol, Vol 14, No 2, pp 191-197, June 1969. 7 p, 2 fig, 9 ref.

Descriptors: *Specific yield, *Aquifers, Groundwater movement, Infiltration, Permeability, Drainage, Porosity, Specific retention, Water storage, Percolation.
Identifiers: Groundwater flow equations.

The concept of the specific yield as it is applied to unconfined aquifers is discussed, and it is shown that the value of the true specific yield is generally a function of both horizontal position and time. Because of the difficulties associated with the measurement of local fluxes and local water-table movements necessary to obtain values of the true specific yield, the average, the bulk and the virtual specific yields are defined, all of which are time dependent and the last 2 of which require the measurement of average fluxes over the catchment area. The non-constancy of the specific yield is illustrated in experimental results obtained with intermittent rainfall over a drainage installation where negative values were obtained, and reached infinite positive and negative values at maximum and minimum water-table heights. (Knapp-USGS)

TRANSIENT FLOWS IN AQUIFERS WITH FREE WATER SURFACES, TAKING INTO ACCOUNT THE UNSATURATED ZONE: CRITIQUE OF CLASSIC ANALOG MODELS (FRENCH),
Grenoble Univ. (France). Laboratoires de Mecanique des Fluides.
G. Vachaud, and J. L. Thony.
Bull Int Ass Sci Hydrol, Vol 14, No 2, pp 199-215, June 1969. 16 p, 5 fig, 1 tab, 22 ref.

Descriptors: *Groundwater movement, *Equations, *Mathematical models, Permeability, Aquifers, Saturated flow, Unsaturated flow, Drainage, Evaporation, Recharge, Hydraulic conductivity, Hydraulic models.
Identifiers: Boussinesq equation.

An attempt was made to consider as a whole the flow of water in both saturated and unsaturated zones. The position of the water table, when considering the hydrodynamics of free surface aquifers, must be controlled by the flow occurring in the unsaturated zone. A system of 2 differential equations, each one related to the saturated and unsaturated zone, is proposed for defining the position of the water table. This replaces the unique classical BOUSSINESQ equation, which is obtained by considering the free surface as the upper boundary of the flow domain. In view of experimental results obtained from the drainage of vertical soil columns, a critique of classical analog models is made. A two-dimensional soil hydraulic model is proposed for obtaining a complete description of the variation of water-content, water fluxes and pressure during unsteady conditions of drainage and recharge. Measurements of changes of water content and pressure may be obtained during unsteady conditions of drainage and recharge by a series of 3 Am-241 sources of gamma-rays and 20 tensiometers and pressure transducers connected to a data-logging system and computer. (Knapp-USGS)

GROUNDWATER STUDIES IN THE SABI VALLEY, RHODESIA, USING NATURAL TRITIUM MEASUREMENTS,
Agricultural Research Council of Central Africa. Hydrology Research Team.
P. Wurzel, and P. R. B. Ward.
J Hydrol, Vol 8, No 1, pp 48-58, May 1969. 11 p, 2 fig, 1 tab, 10 ref.

Descriptors: *Groundwater movement, *Tracers, *Tritium, Base flow, Laboratory tests, Electrolysis, Radio-chemical analysis, Surface-groundwater relationships.
Identifiers: *Sabi Valley (Rhodesia).

Environmental tritium was used as a groundwater tracer in the Sabi Valley Alluvial plain in Rhodesia, and flow data was obtained on a regional scale. It is shown that its groundwater movement is closely approximated by direct flow and the tritium content in boreholes is related to tritium input in 2 areas of recharge. The preliminary results indicate that the Sabi River is playing a greater part in the groundwater regime of the alluvial plain than originally anticipated. Velocity of movement of the groundwater is deduced as 2-5 ft/day. The low level tritium counting system used in the authors' laboratory is briefly described, and the limit and accuracy of measurement is discussed. (Knapp-USGS)

Razved i Okhrana, No 3, pp 46-48, Mar 1969. 3 p, 1 fig.

Descriptors: *Hydrogeology, *Aquifers, *Structural geology, Boreholes, Mapping, Groundwater basins, Discharge (Water), Discharge measurement, Paleozoic era, Quaternary period, Water storage, Water loss, Water structure, Water level, Water circulation.
Identifiers: *Chu basin (Cent. Asia).

The effect of neotectonics on the groundwater fo mation was investigated on the basis of borehol geological, and hydrological data recorded by t Chu (Central Asia) hydrogeological expedition 1966-1967. The study shows that the Chu inte montane basin consists of gravel and boulder be of Quaternary period underlain by the Paleozo metamorphic rocks. The conditions for the acc mulations of groundwaters in the Paleozoic a Quaternary rocks are very dissimilar with specif discharges from boreholes in the Quaternary roc up to 50 lit/sec, whereas discharges from t Paleozoic formations do not exceed 5-10 lit/se The study also shows that the water of the C River, after leaving the Boom Canyon, partly inf trates the soft clastic formations. Hydrolog characteristics of the eastern part of the Chu bas are determined by the neotectonic Paleozoic bas ment block structure. (Gabriel-USGS)

THE MINERAL WATER SPRINGS AT EVIA (FRENCH),
Department of Sciences, Paris (France). Lab. Geology Dynamics.
B. Blavoux.
La Houille Blanche, Vol 24, No 1, pp 21-29, 196 9 p, 12 fig, 1 tab.

Descriptors: *Spring waters, *Water sourc *Mineral water, Hydrologic properties, Geolog mapping, Aquifers, Altitude, Hydrogeolog Precipitation (Atmospheric), Evapotranspiratio Discharge (Water), Runoff, Sedimentatio Glaciers, Water circulation, Water storage, Trit um, Sulfates, Iron, Magnesium, Calcium, Oxyge Water balance.
Identifiers: *France, Evian area.

This paper, a summary of a doctorate thes presented at the Faculty of Sciences, Pari describes the hydrogeological conditions in t Evian area, France. Objective of the work was determine the origin of the mineral springs a their characteristics and to evaluate the amount water stored in the Evian aquifer. Surface geolog cal surveys were made and deep boreholes we drilled into the Quaternary fluvio-glacial form tions in the Lower Chablaie area. Concurrent c matological and hydrochemical studies were ma of the entire catchment area and a groundwat balance was established. It is concluded that t mineral springs have their source in the Quaterna rocks of the Vinzier Plateau. The distribution dynamic and hydrochemical characteristics several places in the aquifer are describe (Gabriel-USGS)

GROUNDWATER AQUIFER PATTERNS AN VALLEY ALLUVIATION ALONG MOUNTA FORK CREEK, CRAWFORD COUNTY, A KANSAS,
H. F. Garner.
Arkansas Academy of Science Proceedings, V 20, 1966, pp 95-103. 9 p, 4 fig, 5 ref.

Descriptors: *Groundwater, *Aquifer.
Identifiers: *Alluviation, Run-off alluvial thickness, Channel-fill.

The study delineates several alluvium-aquifer relations for Boston Mountain drainage systems. Specifically with regard to Mountain Fork Creek, the bulk of the valley is too thinly alluviated to provide extensive alluvial groundwater along long reaches. Also, many of the thicker alluvial sections are composed of poorly sorted colluvium in the form of small valley-side alluvial fans. Only where these accumulations have been subject to valley-side runoff from springs and tributaries have been fine clastic fractions been flushed away and in some cases such gravels are a potential source of groundwater. It should be emphasized that channel fills of aquifer caliber are close to and essentially parallel to the main stream channel except directly downvalley from sharp bends in the channel or on the concave side of large bends where overflow has affected large portions of the valley flat. Also, in the latter areas alluvial thickness seems greatest, and water-well locations in such sites appear to have the greatest potential.

2G. Water in Soils

THEORY OF SEEPAGE FROM OPEN CHANNELS.
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab,
Herman Bouwer.
Advance in Hydroscience, Vol 5, pp 121-172, 1969. 52 p, 32 fig, 3 tab, 46 ref.

Descriptors: *Seepage, *Soil water movement, Soil physics, *Model studies, *Research and development, Infiltration, Open channels, Water table, Mathematical models, Analog models, Computer models, Measurement, Hydraulic conductivity, Permeability.
Identifiers: Open-channel seepage, Seepage prediction.

Prediction of seepage from open channels and the measurement of soil hydraulic properties are discussed in a review of current mathematical and field studies in soil water movement. Solutions are available for seepage rates for a great variety of channel, soil, and water table conditions. Most analyses are for steady-state systems, but some transient systems may be handled. Digital and analog computers permit calculation of many boundary conditions. Recent work in soil physics and soil-property measurement makes possible accurate determination of field parameters and realistic model-making. For main entry see W69-07723. (Knapp-USGS)

A. Hados.
Soil Sci Soc Amer Proc, Vol 32, No 3, pp 297-301, May-June 1968. 5 p, 5 fig, 1 tab, 12 ref, append.

Descriptors: *Heat flow, *Unsaturated flow, *Soil-water movement, *Mathematical models, Mass transfer, Water temperature, Diffusion, Energy transfer, Soil physical properties.
Identifiers: Periodic heat fluctuations, Thermal gradients.

Theoretical predictions of thermally induced moisture transfer have been compared to measured quantities. Soil samples at different initial moisture contents were subjected to sinusoidal heat waves having an amplitude of 6C, and various periods of time. Temperatures were measured at various distances from the heat source, using copper-constantan thermo-couples and recording the emf output. The moisture distribution after the 1st, 2nd, 6th, and 16th cycle was determined gravimetrically. The measured net transfer quantities were found to be larger than the theoretically predicted values by factors ranging from 0.8 to 8.0. The discrepancy between predicted and measured values of net transfer may be attributed to the incompleteness of the theoretical models. (Knapp-USGS)
W69-07964

SELF-DIFFUSION OF TRITIATED WATER IN MONTMORILLONITE AND KAOLINITE CLAY,
Kentucky Univ., Lexington; and Arkansas Univ., Fayetteville.
R. E. Phillips, and D. A. Brown.
Soil Sci Soc Amer Proc, Vol 32, No 3, pp 302-306, May-June 1968. 5 p, 4 fig, 1 tab, 16 ref.

Descriptors: *Diffusion, *Clays, *Tritium, *Tracers, Tracking techniques, Soil water movement, Unsaturated flow, Mass transfer, Diffusivity, Radioisotopes.
Identifiers: Self-diffusion, Montmorillonite, Kaolinite.

The quick-freeze technique of measuring diffusion coefficients of ions in clays and soils was adapted to the measurement of self-diffusion coefficients of tritiated water in clays. The self-diffusion coefficients of tritiated water were approximately equal in the kaolinite and montmorillonite clays. The water contents, oven-dry weight basis, used for montmorillonite were 125.0, 118.5, 100.0, and 87.0%; the water contents used for kaolinite were 60.5, 55.0, 43.5, and 39.0%. The calculated average number of water layers on each mineral surface ranged from 3.5 to 5.5 for montmorillonite and from 17 to 26 for kaolinite. The self-diffusion coefficients increased in a linear manner as the average number of water layers present on each mineral surface increased; a slightly different rate of increase was obtained for each of the 2 clays. The lack of difference of the diffusion coefficients in the 2 clays could not be explained on the basis of charge density of the clays nor was a difference in viscosity a plausible explanation. A longer path length of the diffusing water molecules in the kaolinite and a smaller relative mobility of the diffusing water molecules in the montmorillonite is given as a possible explanation. (Knapp-USGS)
W69-07965

HYDRAULIC PROPERTIES OF A CLAY LOAM SOIL AND THE FIELD MEASUREMENT OF WATER UPTAKE BY ROOTS: 1. INTERPRETATION OF WATER CONTENT AND PRESSURE PROFILES,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
C. H. M. Van Bavel, G. B. Stirk, and K. J. Brust.
Soil Sci Soc Amer Proc, Vol 32, No 3, pp 310-316, May-June 1968. 7 p, 12 fig, 1 tab, 5 ref.

Descriptors: *Soil water movement, *Clay loam, *Irrigation water, *Root zone, Percolation, Unsaturated flow, Soil-water-plant relationships, Water storage, Field capacity, Hydraulic conductivity, Consumptive use, Moisture uptake.
Identifiers: Root extraction (Water).

The distribution of irrigation water in an Adelanto clay loam profile was studied in a field plot by simultaneous, periodic observations of the water content and hydraulic head profiles. Successive measurement series were made with the plot bare and covered, bare, and planted to a sorghum crop. From the first two, the in situ and dynamic relations of water content to water pressure and to conductivity were obtained. From the cropped field data, the root-extraction pattern was derived, using the established hydraulic properties of the profile. The data demonstrate the variability within depths and locations of water retention and conduction properties and the consequent problem of calculating fluxes. The mobile character of soil water is also evident, confirming the inadequacy of static concepts of soil water 'constants' for a profile. Calculated root-extraction rates agreed reasonably with independent lysimetric measurements of the water loss from the surface to the atmosphere. (Knapp-USGS)
W69-07966

HYDRAULIC PROPERTIES OF A CLAY LOAM SOIL AND THE FIELD MEASUREMENT OF WATER UPTAKE BY ROOTS: 2. THE WATER BALANCE OF THE ROOT ZONE,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
C. M. H. Van Bavel, K. J. Brust, and G. B. Stirk.
Soil Sci Soc Amer Proc, Vol 32, No 3, pp 317-321, May-June 1968. 5 p, 7 fig, 1 tab, 14 ref.

Descriptors: *Water balance, *Root zone, *Soil water movement, Lysimeters, Irrigation water, Clay loam, Percolation, Unsaturated flow, Soil-water-plant relationships, Water storage, Hydraulic conductivity, Hydraulic gradient, Consumptive use, Evapotranspiration, Moisture uptake.
Identifiers: Root extraction (Water).

Soil water depletion rates in a 115-cm and a 170-cm deep profile of Adelanto clay loam were compared with lysimetrically obtained consumptive use rates for periods of many days after measured water applications. When the soil was bare, the depletion rates were always higher than the rate of loss to the atmosphere, and the inferred flux at the 170-cm depth was as high as 2 mm/day 8 days after irrigation. When the test plot was planted to sorghum an initially strong downward flux at the 170-cm depth reversed itself after about 10 days and became as high as 4 mm/day, representing upward flow of water from wet soil into the root zone above. The data imply that indiscriminate use of soil water depletion rates as representing consumptive use rates can be highly misleading at any time in an irrigation cycle. Further analysis shows that rational and satisfactory correction of depletion data is not likely feasible, and, at any rate, unworkable for the condition of the experiment. (Knapp-USGS)

LIBRARY U. OF L. URBANA-CHAMPAIGN

COUPLING PHENOMENA AS A POSSIBLE CAUSE OF 'NON-DARCIAN' BEHAVIOUR OF WATER IN SOIL,
Agricultural Univ., Wageningen (Netherlands). Lab. of Soils and Fertilizers.
G. H. Bolt, and P. H. Groenevelt.
Bull Int Ass Sci Hydrol, Vol 14, No 2, pp 17-28, June 1969. 12 p, 4 fig, 2 tab, 15 ref.

Descriptors: *Soil water movement, *Groundwater movement, Flow, Porous media, Darcy's law, Hydraulic gradient, Osmotic pressure, Convection, Ion transport, Diffusion.
Identifiers: Non-Darcian flow, Flow mechanism coupling.

The 'non-Darcian' behavior of water in soils may be caused by the coupling that can occur between the different transport phenomena. It is predicted that a difference in osmotic pressure will arise when solutions flow through porous media, and that due to that difference the resulting flow is related in a non-linear fashion to the applied pressure difference. Several numerical examples are presented. (Knapp-USGS)

DISPERSION AND REACTION IN UNSATURATED SOILS APPLICATIONS TO TRACERS,
Grenoble Univ. (France). Laboratoires de Mecanique des Fluides.
D. E. Elrick.
Bull Int Ass Sci Hydrol, Vol 14, No 2, pp 49-60, June 1969. 12 p, 24 ref.

Descriptors: *Soil water movement, *Unsaturated flow, *Tracers, Dye releases, Radioisotopes, Stable isotopes, Salts, Tracking techniques, Diffusion, Adsorption, Dispersion, Ion transport, Reviews.
Identifiers: Soil water movement tracers.

The commonly used soil moisture and groundwater tracers include dyes such as fluorescein, pyramine and non-fluorescent dyes; anions such as chloride and nitrate; radioactive isotopes either as cation complexes or in anionic forms, and tagged water molecules. In several studies soil moisture movements were measured by isotope tagging. It is worth noting that this method can be employed to determine groundwater recharge. The soil moisture zone is probably the most difficult realm of the environment in which to obtain acceptable tracer behavior. For example, comparisons of tritium and chloride movement in neutral to basic soils from arid regions suggest that chloride ions move at an equal or slightly faster rate than tritium. It has been assumed that chloride ions are repelled from the negatively charged soil particles into the central region of the pores where the water velocity is greatest and that tritiated water exchanges with water adsorbed on the soil particles, thus retarding the tritium movement. Both laboratory and field experiments indicated considerable retardation of the chloride relative to the tritium movement. Thus, the performance of any tracer being considered for soil moisture studies should be tested in the specific soil under investigation. (Knapp-USGS)
W69-07995

CONSIDERATIONS ON THE INFLUENCE OF A GASEOUS ENTRAPMENT PHASE IN POROUS MEDIA (FRENCH),
Louvain Univ. (Belgium). Dept. of Scientific Agronomy.
L. W. De Backer.
Bull Int Ass Sci Hydrol, Vol 14, No 2, pp 61-66, June 1969. 6 p, 2 fig, 14 ref.

Descriptors: *Unsaturated flow, *Porous media, Transmissivity, Diffusion, Solubility, Diffusivity, Hydraulic conductivity, Hysteresis.
Identifiers: *Gas entrapment.

In porous media, entrapped gas is considered as an important factor reducing the transmissibility of fluid. Because entrapment mechanisms are poorly known and entrapped gas content is a function not only of water content but also of time due to the gas solubility, experimental results do not match satisfactorily with the diffusivity or continuum mechanics theories which do not take the entrapped gas phase into account. Measurements of entrapped gas content are presented together with the corresponding water content hysteresis isotherm. (Knapp-USGS)

Descriptors: *Water storage, *Soil water, * water movement, *Hydraulic conductivity, * tention, Osmotic pressure, Moisture str Moisture tension, Field capacity, Moisture uptak Identifiers: Root extraction (Water).

Soil water characteristics obtained on soil core the laboratory at air pressures less than 1 agreed substantially with pressure-water cont relations determined in the field. Thus, in field dies of soil hydraulics, measurement of either wa content or pressure potential may suffice. W the laboratory data were supplemented with a d ble-tube measurement of the saturated conduct ty, the relation between water content and cond tivity was calculated using 2 methods. Of these, one due to Millington and Quirk gave less accu agreement with actual field measurements than the method proposed by Laliberte, Corey Brooks. The latter method, when based on dou tube measurements in the field and pressure c or similar measurements on cores in the laborat appears useful. Retention values measured with pressure membrane method on disturbed soil s ples were out of line with both field and c results, even when the disturbing treatments w minimized. (Knapp-USGS)

MATHEMATICAL SIMULATION OF WAT MOVEMENT THROUGH UNSATURAT NONHOMOGENEOUS SOILS,
Harvard Univ., Cambridge, Mass. Dept. of W Resources.
Flora Chu Wang, and V. Lakshminarayana.
Soil Sci Soc Amer Proc, Vol 32, No 3, pp 329-3 May-June 1968. 6 p, 6 fig, 1 tab, 16 ref.

Descriptors: *Unsaturated flow, *Soil water mo ment, *Mathematical models, Digital comput Synthetic hydrology, Diffusion, Hydraulic cond tivity, Capillary action.
Identifiers: Nonlinear diffusion equation.

The general states of flow of water through uns rated nonhomogeneous soils have been simula by the nonlinear diffusion equation. A numer technique is developed and programmed for IBM 7094 to solve the explicit-implicit differe scheme analog of the nonlinear partial differen equation of parabolic-type. The data utilized in study for the simulated soil profile are obtai from the experimental work of Nielsen et. (1964) for vertical drainage and infiltration. C puted cumulative loss and average rate are reasonable agreement with their field meas ments. The results indicate that the average rat drying and wetting are controlled largely by

ysical properties of the soil and their correspond-
g boundary conditions. (Knapp-USGS)

R/Res Newsletter, Vol 3, No 3, Wisconsin Univ, adison, pp 16-17, August 1968. 3 fig, disc.

escriptors: *Aquatic weed control, Aquatic nts, Eutrophication, Wisconsin.
entifiers: *Mechanical harvesting, Aquatic plant stribution, Compositional index, Harvesting quency, Myriophyllum exalbescens, Lake Men-ta, Wisconsin.

echanical harvesting techniques are used as a ntrol method of increased plant growth in lakes, sulting from overenrichment. To provide in-eased information concerning the types of plants volved and effects of harvesting, the Wisconsin ater Resources Center sponsored a study by iversity of Wisconsin personnel. The first phase entified and mapped the plant communities in ke Mendota's University Bay. Species distribu-n was attributed to bottom soil texture and water pth. A compositional index was calculated by cording species composition of each community terms of percent frequency and relative frequen-of each species. Index ranged from 100 in low trient to 400 in high nutrient lakes. Composi-tional replacement (changes in species and relative importance of each) has taken place since 1922 studies. Compositional index has increased from 294 to 381, with predominant nuisance species presently being Myriophyllum exalbescens. The second phase, determining effects of harvesing, utilized uncut control sections and harvesting sections at various depths and bottom types. Harvesting is concluded to be a successful control measure by reducing regrowth and density, since all cut stems do not resprout immediately. One caution is the necessity of future sampling to monitor changes in species composition as other plants appear to fill the void. (Ketelle-Wisc)

THE EXCHANGE OF DISSOLVED SUBSTANCES BETWEEN MUD AND WATER IN LAKES,
Freshwater Biological Association, Ambleside (England).
Clifford H. Mortimer.
J Ecol, Vol 30, pp 147-201, 1942. 46 fig, 5 tab, 77 ref.

Descriptors: *Mud-water interfaces, *Lakes, Eutrophication, Oligotrophy, Sediments, Reduction (Chemical), Mud, Nutrients, Oxygenation, Oxidation-reduction potential, Conductivity, Circulation, Hypolimnion, Water chemistry, Cycling nutrients.
Identifiers: *Dissolved solutes, *Mud-water exchange, Jenkin sampler, Windermere, Esthwaite Water, Redox, Chemical stratification, Oxygen absorption rate, Eddy diffusion.

Seasonal variation in stratification of temperature, oxygen, alkalinity, pH, ammonium ion, nitrate ion, nitrite ion, silicon, phosphorus, ferric iron, ferrous iron, total iron, and sulfide ion, were illustrated in a series of depth-time diagrams for Esthwaite Water and Windermere lakes. Concurrently, the study of the distribution of redox potential, pH, and conductivity were determined with depth of the undisturbed cores of mud and water above the mud surface. Investigation of seasonal changes in a central water column and underlying mud in five English lakes disclosed relationships between the winter oxygen concentration above the mud surface, mean winter thickness of surface-oxidized mud layer, winter reducing intensity of mud, winter conductivity in mud, organic content of mud, and mean summer oxygen depletion rate in hypolimnion, expressed per unit area of mud surface. Reduction of the mud surface and the associated increase in supply of solutes to the water may be expected to augment plankton production. Examples are quoted. A description of the Jenkin surface mud sampler and the arrangement of redox and conductivity electrodes are given. (Bortleson-Wisc)

ECOLOGICAL HISTORY OF THE ENGLISH LAKE DISTRICT,
W. H. Pearsall, and W. Pennington.
Journal of Ecology, Vol 34, No 1, pp 137-148, Feb 1947. 2 fig, 1 tab, 8 ref.

Descriptors: *Paleolimnology, *Ecology, *History, *Erosion, *Lakes, *Sedimentation, *Eutrophication, Cores, Pollen, Organic matter, Sediments.
Identifiers: *English Lake District, Windermere, Archaeology, Paleoecological studies, Historical lake ecology, Watershed erosion.

The paper contains a summary of the archaeological background of the English Lake District and attempts to correlate the historical record with depth profile patterns of pollen and organic matter in sediment cores of Windermere. Evidence from the pollen and chemical analyses suggest that Windermere drainage system passed through the following stages: (1) a late glacial and immediate post-glacial phase of rapid erosion and stabilization by vegetation (pine-birch forest), (2) a steady state of alder woods and oak forest, (3) a phase of primary (upland) occupation by man and incipient pine forest degeneration (1500 BC to AD 900), (4) a period of secondary (valley) occupation by Norse, increased grazing and accelerated degeneration (900-1300 AD) accompanied by draining alder swamps, (5) period of economic exploitation for wool and timber (c 1300-1750 AD) with extreme woodland and soil degeneration, and (6) romantic period of replanting and amenity exploitation (1750-1940 AD). This article describes the results of the hydrological, geological, biological, and topographical study of the lagoon conducted by the personnel of the R. V. Vityaz during its 36th voyage. The study shows that the hydrodynamic features of the water have a favorable effect on the development of plankton. Diatom content in the suspended matter varies from 1,650 to 17,230 cells per liter, with the maximum number of diatoms found in the surface-water layer near the western shore. Vertically, the amount of organic matter in the suspended matter

LIBRARY U. OF I., URBANA-CHAMPAIGN

decreases rapidly, and less than 5% of the organic matter recorded at the surface is retained at the bottom. The extreme paucity of the benthic population in the deeper parts of the lagoon may be explained by the accumulation there of vast masses of rotting macrophytes. The characteristics of bottom sediments of the lagoon at several stations are analyzed and given graphically. (Gabriel-USGS)

LAKES IN THE CROATIAN LIMESTONE REGION,
Milivoj Petrik.
Hydrol of Fractured Rocks Vol 2, Proc Dubrovnik Symp (Oct 1965), Int Ass Sci Hydrol, Pub 74, pp 565-589, 1967. 25 p, 11 fig, 23 tab, 37 ref.

Descriptors: *Lakes, *Lake morphology, *Limestones, *Water analysis, Hydrologic properties, Thermal stratification, Fractures (Geology), Geochemistry, Geomorphology, Carbonates, Magnesium, Carbon, Oxygen, Chloride, Carbon dioxide, Water structure, Springs.
Identifiers: *Yugoslavia, Croatia, Dalmatia, Islands of Cres and Krk.

This article describes the natural accumulation of water in the limestone region of Croatia, Yugoslavia and contains the analysis of hydrologic, geological, and geochemical conditions present in the several lakes of Dalmatia and of the Krk and Cres islands. The study shows that (1) the lakes of the region are characterized by a relatively low productivity; (2) the water is of the hydrocarbonate type with a mineral content characteristic of spring waters of the lake region; (3) sufficiently deep lakes (about 15 m) show clear thermal stratification; (4) the genesis of water accumulation is of variable character; and (5) development and maintenance of a lake depends upon several factors, the main ones of which are the meteorological conditions and the transmission capacity of subterranean channels. (Gabriel-USGS)

A CONTINUED PRE- AND POSTIMPOUNDMENT SURVEY OF THE HELMINTH AND CRUSTACEAN PARASITES OF MICROPTERUS DOLOMIEUI LACAPEDE, M. PUNCTULATUS (RAFINESOUE) AND M. SALMOIDES (LACEPEDE) (PERCIFORMES) OF BEAVER RESERVOIR IN NORTHWESTERN ARKANSAS,
Arkansas Univ., Fayetteville. Dept. of Zoology.
Wilbur B. Owen.
M.S. Thesis, University of Arkansas, Fayetteville, Arkansas 1969. 57 p, 4 tab, 3 fig, ref, 1 appendix. OWRR Project A-009-ARK.

Descriptors: *Parasites, *Impoundment, *Life cycle, *Physico-chemical fluctuations, Water quality, Intermediate hosts.

The intent of this research was continued pre- and postimpoundment survey to determine the species, number, and extent of parasite infections of Micropterus dolomieui, M. punctulatus, and M. salmoides in Beaver Reservoir in Northwestern Arkansas. A comparison of the fluctuations of parasitism in the three hosts from pre-impoundment through postimpoundment was made. Fluctuations of parasites were compared for three years following the impoundment of the White River watershed. A further objective of this study was to correlate fluctuations in the physicochemical water qualities of the reservoir with the qualitative and quantitative fluctuations of parasitism of the three hosts. Based on the data of this study it is concluded that the explanations of the fluctuations of the parasites following impoundment of the White River depend on the nature of the life cycles of the parasites. The data indicate that in order to draw significant conclusions concerning the correlation of physico-chemical water quality fluctuations, at least 4 to 5 years postimpoundment monitoring of water qualities is necessary.

failure, Erosion, Sedimentation, Discha
(Water), Tracers, Channels, Deposition (S
ments), Tractive forces.
Identifiers: Rubicon River (Calif).

A flood surge at least the equal of any p
Pleistocene discharge was released by failure
rockfill dam in the glacial canyon of the Rubi
River, California. The diorite rockfill in the
embankment acted as a point source of bouk
that could be traced downstream. Particle rou
ness changes were rapid, transition from angula
subangular occurred almost immediately after
itiation of movement, and change from subroun
to rounded took place approximately 1.5
downstream. Over 90% of the size reduc
downstream is due to progressive sorting. M
ment of the rockfill continued to a point 1.6
downstream. Sorting of these deposits increase
regularly downstream. Macroturbulent trans
resulted in the accretion of 5 feet of coarse mate
on a terrace level 28 ft above thalweg at a p
stage of 45 ft. Terrace-like berms formed
backwater areas and flow or wave fronts up to
high formed lobate scarps transverse to the ch
nel. Great lateral supply of coarse material to
channel was caused by the surge but only shor
crements of longitudinal transport occurred.

*Hacking River (Australia).

An intensive lithological, mechanical
morphological investigation into the sediment
the Hacking River, New South Wales, Australi
summarized. Particle roundness increases
calibre decreases, but in sub-granule grades rou
ness declines as size decreases. Unweighted m
roundness does not approach 1.0 asymptotic

wnstream, but first increases to a maximum, ience it declines downstream. Roundness anges at a medium rate in above-cobble grades, stest in cobble-granule range, and slowest in the b-granule grades. Mean roundness evolves wnstream faster than calibre decreases, and libre declines faster than mean sphericity olves. Roundness in the Hacking does not change confluences, because of small tributaries and trographic uniformity of the catchment. While undness dispersion and roundness skewness olve downstream irregularly in the Hacking, in ig sandy rivers roundness decreases downstream; weighted mean roundness is attained, and roundss approaches+1.0 asymptotically downstream. napp-USGS)

entifiers: Delta sedimentation model.

e major processes that influence deltaic sedient distribution were studied in a laboratory me and stilling basin. The quantity and size of diment, the discharge of water, and the still water vel were held constant. The flume was 30.5 m ng, 7.32 m wide, and 0.61 in deep. Standard viation, skewness, and kurtosis of the data are mmarized graphically. As the height of the delta creased, standard deviation of the grain size inased because length of foresets diminished, lesning the length of path available for sorting. ere was no apparent increase in kurtosis and ewness with mean grain size. There was a cyclic ange in particle size alone, cross sections during position. Particle size increased down the esets. The relation of flow parameters to size disbution may be used to predict reservoir sedimenion or to calculate past flows from preserved dimentary sequences. (Knapp-USGS)

REGIONAL DIFFERENTIATIONS OF THE SUSPENDED SEDIMENT TRANSPORT IN THURINGIA AND THEIR RELATION TO SOIL EROSION,
Deutsche Akademie der Landwirtschaftswissenschaften zu Berlin (East Germany).
L. Bauer, and W. Tille.
Comm of Surface Waters, Proc Gen Assembly of Bern (Sept-Oct 1967), Int Ass Sci Hydrol, Pub No 75, pp 367-377, 1967. 11 p, 4 tab, 21 ref.

Descriptors: *Sediment transport, *Suspended load, *Erosion, *Provenance, Sediment yield, Sediment discharge, Silts, Sands, Discharge (Water), Streamflow, Runoff.
Identifiers: *Thuringia (Germany), Unstrut River.

During the hydrologic years 1961 and 1962, 13 sampling stations within the watershed of the river Unstrut, Germany, carried out systematic measurements of the suspended sediment charge. Statistical analysis of the data showed partially significant differences between the mean values of different cross sections within the area which covers only about 5,000 sq km. The functions for estimating suspended sediment discharge, which state the average increase of the suspended sediment discharge in g/s with the water discharge in cu m/sec were calculated for 11 cross sections after the simplified method of Remy-Berzencovich (1960). Sediment discharges are tabulated. (Knapp-USGS)

DRIFT BALANCE OF THE KURA RIVER IN ITS LOWER COURSE,
Akademiya Nauk Azerbaidzhanskoi SSR, Baku. Institut Geografii.
S. G. Rustamov.
Comm of Surface Waters, Proc Gen Assembly of Bern (Sept-Oct 1967), Int Ass Sci Hydrol, Pub No 75, pp 391-400, 1967. 10 p, 1 fig, 1 tab.

Descriptors: *Sediment transport, *Suspended load, *Regime, *River regulation, Reservoirs, River training, Water management (Applied), Bank erosion, Sedimentation.
Identifiers: *USSR, *Kura River (USSR), Arax River (USSR).

Construction of the Mingechaur reservoir on the Kura River, USSR, abruptly changed the river's characteristics, particularly its sediment load and meander form. Regulation changed annual streamflow from 18.7 cu km to 16.7 cu km. Suspended load decreased from 211 g/cu m to 25 g/cu m above the confluence of the Arax River and from 2,007 to 1,651 gm/cu m below the confluence. Deposition on the flood plain decreased from 38 to 19.2 million tons. The amplitude and rate of migration of meanders greatly decreased. (Knapp-USGS)

SEDIMENT TRANSPORTATION IN RIVER CHANNELS WITH FLOOD PLAINS,
Gidrometeorologicheskii Institut, Leningrad (USSR).
N. B. Barishnikov.
Comm of Surface Waters, Proc Gen Assembly of Bern (Sept-Oct 1967), Int Ass Sci Hydrol, Pub No 75, pp 404-412, 1967. 9 p, 2 fig, 1 tab, 12 ref.

Descriptors: *Sediment transport, *Alluvial channels, *Model studies, *Floods, *Flood plains, Hydraulic models, Alluvium, Sediment load, Sediment discharge, Sands, Turbulence, Streamflow, Velocity.
Identifiers: USSR, Stream models.

The influence of turbulence on alluvial channel sediment load was studied in over 200 flume experiments. The channels studied had rectangular cross sections and unilateral rectangular flood plains. The channel discharge decreased markedly when the flood plain and channel discharged together. This decrease was directly proportional to flood plain hydraulic roughness. The mean channel velocity decreased and velocity distribution in the channel became more uniform when water flowed on the flood plain. (Knapp-USGS)

THE EFFECT OF WATER DETENTION STRUCTURES ON RIVER AND DELTA MORPHOLOGY,
Colorado State Univ., Fort Collins, Dept. of Civil Engineering; and Agricultural Research Service, Fort Collins, Colo. Northern Plains Branch.
H. Y. Chang, D. B. Simons, and R. H. Brooks.
Comm of Surface Waters, Proc Gen Assembly of Bern (Sept-Oct 1967), Int Ass Sci Hydrol, Pub No 75, pp 438-448, 1967. 11 p, 6 fig, 1 tab.

Descriptors: *Sedimentation, *Bed load, *Deltas, *Channel morphology, Model studies, Hydraulic models, Alluvial channels, Dams, Banks, Beds, Channel improvements, Structures, Hydraulics, Flood control, Storage.
Identifiers: Delta morphology.

The effect of flood-water retarding and sediment detention structures upon river morphology, including aggradation of river channels and reservoir deltas, has been studied in a large laboratory model basin. Constant rates of water and sediment (essentially bed-materials) were fed into a channel with a resulting flow of water and sediment into a reservoir at a constant depth. The banks of the channel were made stable for most of the runs. The river and delta morphology are discussed in terms of channel aggradation and degradation induced by delta growth and a sudden change of sediment feeding rate, water discharge, reservoir base level, or delta thickness. Shape factor for deltas is defined as the width-length ratio of the deltas when approximated as the shape of an ellipse. The shape factor generally increases in value for deltas developed when the channel is aggrading, and decreases in value for deltas developed when the channel is degrading. The mechanics of river flow and the accompanying changes in delta shape are discussed in terms of equivalent stream length. (Knapp-USGS)
W69-07761

THE RESULTS OF CONTINUOUS BED LOAD MEASUREMENTS RELATED TO FLUCTUATIONS OF THE RIVER BED,
Netherlands Rijkswaterstaat, Arnhem. Section of River studies.
A. Zanen.
Comm of Surface Waters, Proc Gen Assembly of Bern (Sept-Oct 1967), Int Ass Sci Hydrol, Pub No 75, pp 489-500, 1967. 12 p, 6 fig, 5 ref.

Descriptors: *Bed load, *Sampling, *Measurement, Laboratory tests, Dunes, Sediment transport, Model studies, Hydraulic models.
Identifiers: Bed load sampling.

The relation between bed load movement and location on duned beds was studied in the laboratory to determine optimum bed load sampling and sampler calibration techniques. Sand transport is intermittent, with maximum movement at dune crests and minimum movement just downstream. The amount of sand caught in a sampler depends on its position on dunes. Modification of sampling techniques to sample all parts of several dunes will give more representative results. (Knapp-USGS)

Descriptors: *Sediment transport, *Alluvial channels, *Measurement, *Estimating, Channel morphology, Dunes, Turbulence, Roughness (Hydraulic), Meanders.

LIBRARY U. OF L. URBANA-CHAMPAIGN

Identifiers: USSR, Sediment transport estimation.

River bed evolution is a form of sediment transportation by flowing water. River bed evolution can be divided into 2 types distinguished by dune motion of sediments and meandering. A system of characteristics expressing principal deformation features peculiar to different types of river bed evolution was elaborated. Mapping showed some relations between individual morphometrical characteristics, deformation velocity and influencing factors. By means of hydromorphological analysis, it is possible to simplify choice of engineering structures location, choose the most effective defense measures, and forecast river bed deformation. One of the computation methods is based on consideration of dune motion and its dependence on hydraulic factors, and may be used to solve many engineering problems, including bed-load discharge determination, channel form migration, minimum and maximum depths, channel sedimentation, erosion of the dune crest, etc. Another computation method correlates channel forms with abruptly changing flows. (Knapp-USGS)

TRANSPORT VELOCITIES OF SINGLE PARTICLES IN BED-LOAD MOTION,
Louisiana State Univ., Baton Rouge. Coastal Studies Inst.; and Uppsala Univ. (Sweden). Dept. of Physical Geography.
Nils Meland, and John Norrman.
Geogr Ann, Vol 48A, No 4, pp 165-182, 1966. 18 p, 6 fig, 1 tab, 28 ref.

Descriptors: *Sediment transport, *Bed load, *Model studies, *Hydraulic models, Laminar flow, Turbulent flow, Reynolds number, Particle size, Shape, Roughness (Hydraulic), Saltation, Velocity.
Identifiers: Bed load transport.

In order to determine the influence of shear velocity, bed roughness and moving particle diameter on particle bed-load transport, velocities of single spherical glass beads moving over beds of rhombohedrally packed spherical glass beads were determined under controlled laboratory conditions. A relationship between the position of zero water velocity and bed roughness is established. Three stages of particle motion are recognized from a plot of bead velocity on particle diameter. The degree of development of each is a function of all three major variables. An empirical solution is offered where particle velocity is considered a function of shear velocity, bed roughness, and particle diameter. A more detailed consideration of the forces which tend to propel and retard a moving particle leads to the development of a semi-empirical expression for the velocity of a single particle in contact-load motion. STUDIES ON THE SAND TRANSPORT IN STREAMS WITH TRACERS,
Kyoto Univ. (Japan). Disasters Prevention Research Inst.
Katsumasa Yano, Yoshito Tsuchiya, and Masanori Michiue.
Bull of Disaster Prev Res Inst, Kyoto Univ, Vol 18, Part 3, No 141, pp 1-16, Feb 1969. 16 p, 18 fig, 2 tab, 11 ref.

Descriptors: *Sediment transport, *Stochastic processes, *Mathematical models, *Hydraulic models, Model studies, Flumes, Sediment discharge, Sediment load, Bed load, Sands, Gravels, Flumes, Streams.
Identifiers: Japan.

A stochastic model of the transport of uniformly graded sand and gravel in streams is proposed. The model was verified using colored sand as tracers in alluvial streams and in laboratory flumes. Model calculations were in good agreement with experimental values. Sand grains move in steps, with an average length of about 80-250 times grain diameter. Step length increases with flow intensity. At high intensity, sediment discharge increases with step length, but at low intensities, sediment discharge is a function only of probability of initiation of grain movement. (Knapp-USGS)

CARBONATE TURBIDITES, GULF OF MEXICO,
Texas A and M Univ., College Station. Dept. of Geology.
David K. Davies.
Contract No. 14-08-0001-10866 USGS. Proj No. 15265 Texas A and M. J Sediment Petrol Vol 38, No 4, pp 1100-1109, Dec 1968. 10 p, 8 fig, 1 tab, 29 ref.

Descriptors: *Sedimentation, *Carbonates, *Limestones, *Turbidity currents, *Gulf of Mexico, Continental slope, Oceans, Sediment transport, Provenance.
Identifiers: Carbonate turbidites.

Carbonates of shallow water origin have been recovered from an area of some 39,000 sq mi in the Gulf of Mexico abyssal plain. These carbonates occur most commonly as layers of variable thickness (2-120 cm) in cores of Pleistocene-Recent sediments. Cores from the southern edge of the abyssal plain reveal a remarkable lithologic simplicity and orderliness, characterized in general by a vertical repetition of members: (1) a basal white or light gray, medium calcilutite, 30 cm in average thickness, which is commonly cross-laminated and contains an abundant shallow water benthonic fauna; overlain by (2) a light olive-gray, fine calcilutite, some 35 cm in average thickness, which is commonly bioturbated and consists of a mixture of comminuted shells, micrite, and argillaceous lutite and which contains both planktonic and shallow water benthonic fauna; (3) an gray-olive black argillaceous lutite, 50 c average thickness, which may be bioturbat structureless, and which contains a scattered p tonic fauna. Each core consists of several sequences, each of which represents depo from a mature turbidity-current that originat the Campeche Shelf, and which was followed period of characteristic abyssal plain sediment of argillaceous lutites. Areal distribution of th bidites suggests that occasionally the travelled beyond the present northern limits abyssal plain--a total travel path of 350 miles tremendous quantities of detrital sediment originated from the Mexico and Texas contin shelves, as well as from the Mississippi River, buried the carbonate turbidites beyond depths or diluted these flows in the south northwest, and east of the abyssal plain. (K USGS)

REWORKING OF GLACIAL SEDIMENT THE NORTHWEST ARM, A FJORD- INLET OF THE SOUTHEAST COAST OF N SCOTIA,
Smithsonian Institution, Washington, D. C. D Sedimentology.
Daniel J. Stanley.
J Sediment Petrol, Vol 38, No 4, pp 1224- Dec 1968. 18 p, 14 fig, 43 ref.

Descriptors: *Estuaries, *Sedimentation, *G drift, Erosion, Deposition (Sediments), Sed transport, Silting, Partial size, Particle shape, ment distribution.
Identifiers: Halifax (Nova Scotia), Sedime working.

The morphology, water mass properties, and ments in a small fjord-like inlet on the At coast of Nova Scotia, the North West Arm, examined in an attempt to evaluate process lated to the reworking of glacial drift in the m environment. The Arm, an open system with cal, chemical, and biological exchanges with beyond its mouth, is not a simple 'sediment The present sediment distribution conforms c with morphological features and with patte current flow. The original Pleistocene diam till deposits (gravel to mud admixtures) have mechanically reorganized during the period fo ing submergence of the former glaciated Winnowing and by-passing, when carrie completion, result in the formation of gravel ments in areas strongly affected by currents the deposition of fine-grained material on les rent-agitated bottoms. Less well-sorted te varieties result from incomplete winnowing from the introduction of fine-grained mater coarse gravel 'lag' pavements. These interm sediment types, gradational between origin deposits and better sorted mud and gravel members, clearly do not fall in either reli modern sediment categories as usually de The patchy nature of the sediment distributio the wide range of textural types observed Arm are characteristics common of subm coastal embayments and shelves off glaciate gions in general. It is quite likely that some processes still active in the North West Arm the type that modified Pleistocene glacial dr continental margins during early phases transgression by the Holocene sea. SEDIMENTATION IN AN ARCTIC LAKE,
Department of Energy, Mines and Reso Burlington (Ontario). Great Lakes Div.; an tawa Univ. (Ontario). Dept. of Geology.
J. P. Coakley, and B. R. Rust.
J Sediment Petrol, Vol 38, No 4, pp 1290- Dec 1968. 11 p, 7 fig, 2 tab, 18 ref.

Descriptors: *Sedimentation, *Arctic, * Cold regions, Silts, Sands, Mud, Permafrost, ing, Sediment transport, Deposition (Sedimen Identifiers: Stanwell-Fletcher Lake (Canada).

nwell-Fletcher Lake is 400 mi north of the Arc- Circle, covers 131 sq mi, and is over 100 m p. Its size and the severe climate restrict mer melting of ice to the margins. The ice insu- s the water, which remains essentially isother- , warming slightly from 1.3 to 1.6 deg C, during summer. Inflowing water is nearer 4 deg C, and efore sinks and mixes with the lake water, a cess which maintains thermal and chemical nogeneity in the lake and oxygenates the surfi- bottom sediment. Sedimentation is very slow ause of the short period of stream flow and the organic activity in the lake. Silty sand derived n river bed loads accumulates on shallow mar- l deltas and shelves. The sediment is poorly ed because ice cover prevents wave action and oval of the fine material to deeper water. Mud ved largely from the suspended loads of rivers, es slowly in the central part of the lake. Faint inae in the shelf sands may be varves, but the o water mud is structureless. Evidently seasonal mentary variations do not affect the center of lake, probably because ice cover minimizes sporting currents. The oxidation-reduction ndary in the sediment is at 5-20 cm, deeper in temperate lakes, because of oxidation at the bottom and slower reduction within the sedi- t. (Knapp-USGS)

ntifiers: Continental shelf sediments.

mistry of pore waters from cores from the inner outer shelf off Long Island, New York was pared with that of the overlying sea waters. es from the inner shelf consist of clean sands, reas those from the outer shelf contain mud. In types, the chlorinity and the Ca/Cl, K/Cl, and Cl ratios are higher in the interstitial waters in the overlying waters. The Mg/Cl and Li/Cl os are about the same, but Li/Cl ratios are er on the inner shelf than on the outer shelf. Sr/Cl ratio is highest for the surface waters, est for the interstitial waters, and of inter- iate values in bottom waters. Values of pH and are lower in the core waters than in the overly- waters. The decreases in pH and Eh below the er/sediment interface are attributed to the ac- y of anaerobic bacteria. The reasons for the r chemical changes may result from diagenetic nges. Clays may act as semipermeable mem- nes during compaction and retain salt while ex- sing less saline water. This does not seem ap- able to the clean sands of the inner shelf. The ease of Ca/Cl ratio may be a result of dissolu- of aragonite from shells in the enclosing sedi- nts. If true, it is surprising that the Sr/Cl ratio reases as the Ca/Cl ratio increases. The increase he K/Cl and Rb/Cl ratios may result from the olution of K-feldspar. (Knapp-USGS)

ANIUM DISTRIBUTION IN ARAL SEA SEDI- NTS,
demiya Nauk SSSR. Institut Okeanologii.
. Kochenov, and G. N. Baturin.
l edition of Akad Nauk, SSSR, transl by Amer phys Union, Wash, DC. Oceanology, Acad Sci SSR, Vol 7, No 4, pp 484-487, 1967. 4 p, 1 fig, b, 7 ref.

Descriptors: *Lake beds, *Uranium radioisotopes, *Sediments, Water chemistry, Sands, Clays, Mud, Silts, Carbonates, Carbon, Estuarine environment, Detritus, Organic matter, Salinity.
Identifiers: *Russia, Aral Sea Sediments, Uranium bearing sediments.

Uranium distribution in the Aral Sea sediments was investigated by using samples collected in August to October 1965 and earlier publications. The Aral Sea, which is a shallow basin of mean depth of about 20 m, receives its water and minerals from the Amu Dar'ya and Syr Dar'ya Rivers, with the greater part of the sediments of the sea derived from the suspended matter of these rivers. The least uranium content (0.0001-0.0002%) is found in the sands and silty ooze of the coastal zone and is increased to 0.01% in the calcareous and argillaceous sediments of the central area of the basin. The distribution of uranium in the water over the sea area is uneven, varying from 0.00003-0.000035 g/l in the river estuaries to 0.00005-0.00006 g/l in the central part of the sea. It is of interest to note the sediment: lake water uranium content ratio which varies from 1:200 to 1:300, an extremely low ratio. (Gabriel-USGS)

A CRITICAL REVIEW OF CONVENTIONAL BED LOAD FORMULAE,
Universityof Strathclyde, Glasgow (Scotland). Dept. of Civil Engineering.
John G. Herbertson.
J Hydrol, Vol 8, No 1, pp 1-26, May 1969. 26 p, 6 fig, 3 tab, 29 ref, append.

Descriptors: *Sediment transport, *Bed load, *Reviews, Suspended load, Simulation analysis, Mathematical models, Bibliographies, Synthetic hydrology, Mathematical studies, Channel morphology, Particle shape, Particle size.
Identifiers: *Similitude theory.

Certain of the conventional forms of bed load formulae are examined using similtude theory as a common basis of comparison. The particular form of similitude theory employed is the method of synthesis presented recently for sediment transport studies by Barr and Herbertson. It is emphasised that any bed load formula is at best an approximation due to the arbitrary nature of the subdivision of total sediment load into wash, suspended and bed load fractions. The particular formula chosen for examination are considered to be representative of bed load formula in general. It is shown that the formula are based on alternative forms of general similitude sediment transport equations and consist of incomplete versions of these equations. Most commonly omitted are terms such as the ratio of sediment to fluid density and the ratio of a linear channel dimension, say flow depth, to sediment grain size. This effectively limits the applicability of the formula to very narrow bands without which there can be little justification for comparison of results obtained by use of the formula. (Knapp-USGS)

CHEMICAL PROPERTIES OF GROUND WATER AND THEIR CORROSION AND ENCRUSTATION EFFECTS ON WELLS,
Geological Survey, Washington, D. C.
Ivan Barnes, and Franke E. Clarke.
Geol Surv Prof Pap 4898-D, 1969. 58 p, 27 fig, 7 tab, 47 ref, 2 append.

Descriptors: *Water chemistry, *Water quality, *Water wells, *Well screens, *Fouling, Chemical potential, Corrosion, Well casings, Aquifers, Chemical reactions, Equilibrium, Corrosion control, Groundwater.
Identifiers: *Egypt, *West Pakistan, *Nigeria, Encrustation effects.

Well waters in Egypt, Nigeria, and West Pakistan were studied for their chemical properties and corrosive or encrusting behavior. From the chemical composition of the waters, reaction states with reference to equilibrium were tested for 29 possible coexisting oxides, carbonates, sulfides, and elements. Of the 29 solids considered, only calcite, calcium carbonate, and ferric hydroxide showed any correlation with the corrosiveness of the waters to mild steel (iron metal). All 39 of the waters tested were out of equilibrium with iron metal, but those waters in equilibrium or supersaturated with both calcite and ferric hydroxide were the least corrosive. Supersaturation with other solid phases apparently was unrelated to corrosion. A number of solids may form surface deposits in wells and lead to decreased yields by fouling well intakes or increasing friction losses in casings. Calcite, hausmannite, manganese spinel, three iron sulfides, copper hydroxide, and manganese hydroxide, were all identified in the deposits sampled. Of geochemical interest is the demonstration that simple stable equilibrium models fail in nearly every case to predict compositions of water yielded by the wells studied. Only one stable phase (calcite) was found to exhibit behavior approximately predictable from stable equilibrium considerations. (Knapp-USGS)

RECONNAISSANCE OF THE CHEMICAL QUALITY OF SURFACE WATERS OF THE SAN ANTONIO RIVER BASIN, TEXAS,
Geological Survey, Austin, Tex.
Jack Rawson.
Tex Water Develop Board Rep No 93, Apr 1969. 24 p, 9 fig, 6 tab, 25 ref.

Descriptors: *Water quality, *Water chemistry, *Texas, Streamflow, Data collections, Sampling, Chlorides, Sodium, Salts, Water pollution, Water sources.
Identifiers: *San Antonio River (Tex).

The kinds and quantities of minerals dissolved in surface waters of the San Antonio River basin are related principally to the geology of the area and to rainfall and streamflow characteristics. Municipal and industrial wastes have degraded the natural quality of water in some streams. Rocks exposed in the basin range in age from Cretaceous to Quaternary. The upper part of the basin is underlain by the Edwards and associated limestones and Glen Rose Limestone. Streams that traverse these outcrops usually contain less than 325 mg/l dissolved solids but are very hard. Principal chemical constituents are calcium and bicarbonate. Dissolved-solids content of water in the lower reach of Medina River averages more than 325 mg/l because of municipal and industrial pollution. The chemical composition of water in streams that traverse younger formations in the central and lower part of the basin is variable. However, the dissolved-solids content of most streams not appreciably affected by pollution averages less than 200 mg/l. Water in these streams usually is moderately hard. Although the chemical quality of water in the mainstem San Antonio River and the lower reach of Cibolo Creek is being degraded by municipal, industrial, and irrigation wastes, the discharge-weighted concentration of dissolved solids in both streams averages less than 500 mg/l. Water in both streams usually is very hard. The chloride content of surface waters in the basin generally averages less than 20 mg/l, except in areas where the chemical quality is being degraded considerably by pollution. The concentration of chemical constituents in surface waters throughout much of the basin is within limits recommended by the U.S. Public Health Service for domestic use. The waters also are suitable for most irrigation uses; however, the water throughout much of the basin is moderately hard or very hard and will require softening for most industrial uses. des, Finite difference methods, Net flows, Cir-
tion patterns, Tidal excursions, Tidal prisms,
vective-dispersion transport.

ming complete vertical mixing, a two-dimen-
al time dependent model is described which
ides spatial and temporal variations of tidal
s and amplitudes. The model accounts for vari-
physiographic features found in shallow estua-
variable inflows, low tidal action, and other
ologic characteristics. The model further pro-
s for the inclusion of wind stress and Coriolis
es. The basic outputs from the model are the
histories of tidal amplitude and velocity in
of two spatial coordinate directions. Data that
be obtained from the model include phase rela-
s, time of flood, ebb, and slack tides, net flows,
lation patterns, tidal excursions, and tidal
ns. The model is designed in such a manner
its basic output serves as directed input to a
vective-dispersion model. Although dispersion
eling is not discussed in this report, the inter-
between these two models is described where
opriate, as the output from the tidal
odynamic model is determined in part by the
irements for convective-dispersion or trans-
models.

Identifiers: *Multistage flash distill, Interbasin water transfer, Crop yield, Lower Colorado River Basin, Irrigation requirement.

A study was performed to evaluate potential applications of multistage flash distillation and electrodialysis processes for desalting saline irrigation water near Yuma, Ariz. The investigation determined the associated costs and benefits and gave benefit-cost ratios. Benefits from desalting are generated by shifts to more profitable cropping patterns, increasing crop yields, reducing water use, reducing costs for water application and drainage, and increasing the flow of farm products. Costs are based on project features such as desalting plants and steam generating equipment, raw water collection facilities, storage reservoirs, conveyance and distribution systems, brine disposal systems, blending facilities, gypsum addition systems, and water treatment facilities. Desalting is expected to find many important applications to agriculture in the near-term future. Competition with other water development possibilities such as interbasin water transfer, weather modification, new salt-tolerant crop varieties, and structural and nonstructural salinity control measures on streams will be involved. DESALTING,
Office of Saline Water, Washington, D. C.
Joseph J. Strobel.
Water Reuse, Amer Inst Chem Eng Progr Symp, Ser No 78, Vol 63, pp 114-119, 1967. 6 p, 9 ref.

Descriptors: *Desalination, *Water treatment, *Water costs, Desalination apparatus, Desalination processes, Water supply, Water yield, Water utilization, Saline water, Sea water.
Identifiers: Desalination economics.

Desalting is expected to be an important future source of new freshwater supply. Current technology includes distillation, membranes, crystallization, and ion exchange. Additional research is necessary to lower desalting costs further. Desalting should be considered with other alternatives in development of any incremental water supply program. Current developments are solving technical limitations. Economic possibilities for providing municipal and industrial water are expanding. Future projections of desalting seawater in large plants in the early 1970's are in the range of 22 cents/1,000 gal. and 15 cents or lower after 1975 if predicted low-cost energy is available. Summaries of recent feasibility studies for desalting plants are given and the relation of desalting to pollution is discussed. (Knapp-USGS)

VACUUM FREEZING VAPOR COMPRESSION PROCESS: ONE AND FIVE MILLION GALLON PER DAY DESALTING PLANTS,
Colt Industries, Inc., Beloit, Wis.
R. Consie, R. Darling, D. Emmermann, J. Fraser, and W. Johnson.
Office of Saline Water, Research and Development Progress Report No 451, May 1969. 67 p. OSW 14-01-0001-532.

Descriptors: *Desalination processes, *Freezing, *Cost analysis.
Identifiers: *Vacuum freezing, *Cost studies, *Cost estimates, Direct melting.

Cost studies have been prepared for one and five million gpd vacuum freezing vapor compression desalting plants. These plants use 500,000 gpd factory assembled units in groupings of two and ten to form the desalting plants. Costs for 1 and 5 million gpd plants are 61.5 and 51.3 cents per 1000 gallons respectively. Capital costs of the plants are $1.26 and $1.10 per gallon of daily capacity. The estimated power consumption is 27 KWH/1000 gallons. Fully automatic operation of the plants is assumed thus reducing the labor costs to a minimum. The 500,000 gpd unit is based on the use of a direct melting concept. (Gransee-Office of Saline Water)

HYDRODYNAMIC STUDIES FOR ELECTRODIALYSIS,
McDonnell-Douglas Astronautics Co., Newport Beach, Calif.
G. Belfort, and G. A. Guter.
Office of Saline Water R and D Report No 459, 1969. 144 p. OSW 14-01-0001-1313.

Descriptors: *Desalination, *Electrodialysis, *Membrane process, Hydrodynamics, Screen spacers.
Identifiers: *Desalination apparatus, *Electrochemistry, Solution velocity, Current density.

The hydrodynamic effectiveness of various spacer screens for electrodialysis was studied with the aid of a novel photographic technique in which exposed photographic paper was used in the place of ion-selective membranes, and photographic developer was used in the place of brine. This technique produced a visual record of the membrane-solution interfacial flow patterns in electrodialysis cells. Additional tests were conducted and criteria established for the characterization of each screen with respect to porosity, dead flow area, drag coefficient, and influence on electrical resistance. All of the experimental work was based on the installation of one or more layers of each candidate screen in the open central portion of a 40 mil thick rectangular gasket. The experiments demonstrated that some screens are considerably more effective than others in improving electrodialysis performance, especially at flow rates that give Reynolds numbers greater than 180. Seven (out of 21) of the more promising screens were further evaluated in electrodialysis batch tests to determine how current efficiency, membrane stack pressure drop, and total power requirements vary with flow rate. Two new materials, not previously used in commercial electrodialysis equipment are recommended for further study. (Mintz-Office of Saline Water)

gy, Water wells, Water quality, Water yield, Recharge, Hydrologic data, Data collections, Water levels, Hydrogeology, Groundwater basins, Water sources.
Identifiers: *Wind River Indian Reservation (Wyo).

The potential yield and quality of water from most rocks in the Wind River Indian Reservation, Wyoming, are poorly known, but estimates may be based on local well data and on data concerning similar rocks in nearby areas. Yields of more than 1,000 gpm are possible from the Ordovician to Pennsylvanian limestones, dolomites, and sandstones. Total dissolved solids range from about 300 to 3,000 ppm. Yields of as much as several hundred gpm are possible from Jurassic and Triassic sandstones. Dissolved solids are generally high. Most wells in Cretaceous rocks yield less than 20 gpm. Dissolved solids range from about 200 to 5,000 ppm. Many parts of the Wind River Irrigation Project have become waterlogged. The relations of drainage problems to geology in the irrigated areas are partly defined by sections drawn on the basis of test drilling. Water from underground storage in alluvium could supplement irrigation water from surface sources in some areas to reduce the need for additional surface-storage facilities as well as to alleviate drainage problems in the irrigated areas. Descriptors: *Riparian water loss, *Riparian plants, *Streamflow, Evapotranspiration, Consumptive use, Transpiration, Storage, Seepage, Banks, Alluvial channels, Specific yield, Water levels.
Identifiers: Streamflow loss.

Water losses along stream channels in the semiarid southwestern United States are of utmost importance when considering water disposition and water yields from a watershed. An analysis is described for estimating the disposition along a reach of a natural stream channel with a riparian vegetation and impermeable bedrock at a shallow depth. Results for one annual cycle are presented which indicate the quantity of water removed from the stream channel reach by various processes. Methods were adapted for the particular set of conditions to measure subsurface water flow and water storage in the channel alluvium. Subsurface water flow was calculated from Darcy's equation. Water storage was estimated from water content, water table elevation, specific yield and volume of alluvium measurements. Four distinct water-use periods were apparent within a yearly cycle, each expressed by a separate water balance equation. Water losses by evapotranspiration were estimated from these equations. For example, 9 mm of water were estimated to be lost per day by transpiration of the riparian vegetation during the months of May and June, a time of water shortage in the area. Total depth of annual water loss by evapotranspiration from the channel reach was estimated to 131 cm of water (4.3 acre-ft/acre). (Knapp-USGS)

The author admits that conservation may stand in the way of economic development. The possibility of influencing the rate of development was glossed over in the old conservation. The new conservation is concerned with transferring natural products from present uses in favor of different present uses. The tools of economics are inadequate for handling this type of policy. The author assigns to economists with the following tasks: (1) discovering the abstract or theoretical categories within which conservation demands, if they are found to exist, are to be found; (2) measuring the strength of these demands; and (3) comparing conservation demand with developmental demand. The remainder of the article is devoted to an analysis of these suggestions. Thus, although not specifically concerned with water resources, the analysis of economics in conservation should prove useful in the area of water resource development. (Murphy-Rutgers)

WATER REQUIREMENTS AND USES ARIZONA MINERAL INDUSTRIES,
Bureau of Mines, Denver, Colo. Div. of Mi Resources.
M. M. Gilkey, and Robert T. Beckman.
Bur of Mines Inform Circ No 8162, 1963. 97 p fig, 8 tab, 8 ref.

Descriptors: *Water utilization, *Ariz *Mineral industry, Mills, Mining, Water re Water quality, Mine water, Industrial water, C ing water, Recirculated water.
Identifiers: Metals industry.

The effects of water shortage on Arizona's min industries are described. The information was tained in interviews with company representati

erations covered included all metal mines using bstantial quantities of water and all concentra- rs and smelters. Also included in the survey were operations in the nonmetallic group; 22 in the ting, metal-fabricating, and metal-forming tegories; 1 public-utility power company; and 6 ter companies. At many operations, inadequacy the supply necessitated large-scale recirculation. w water from 6 of 21 sources sampled is ackish, and 8 of 11 samples of recirculated water re brackish. Cost of new water from company- ned wells at 14 operations ranged from 1.0 cent r 1,000 gal to 57.7 cents per 1,000 gal, with an erage of 12.5 cents per 1,000 gal, including wer, labor, and supplies. Recirculation costs for wer, labor, and supplies at 3 copper operations nged from 1.0 cent to 1.8 cents per 1,000 gal. e mineral-product value of copper, lead, zinc, d byproducts is equivalent to $15.27 for each 00 gal of new water and $26.29 for each 1,000 of consumed water. Thus, a much greater um in product value can be obtained from water ed for mineral production rather than for the oduction of many other commodities. (Knapp-GS)

DROLOGIC CONDITIONS IN THE GILA ND BASIN, MARICOPA COUNTY, IZONA,
ological Survey, Phoenix, Ariz.
S. Stulik, and Otto Moosburner.
iz State Land Dep Water-Resources Rep No 39, r 1969. 63 p, 10 fig, 4 tab, 19 ref.

scriptors: *Water level fluctuations, *Water ources, *Groundwater, *Surface waters, rizona, Irrigation water, Water wells, Data col- tions, Irrigation, Water supply, Streamflow, servoirs, Infiltration, Water yield.
ntifiers: Gila Bend (Ariz), Gila River.

oundwater from irrigation wells and surface ter diverted from the Gila River supply the water ed to irrigate about 20,000 acres of cultivated d in the Gila Bend basin. The depth to water nged from less than 50 to more than 350 ft below land surface in spring 1966. Changes in water els vary with the amount and distribution of mpage. The rate of water-level decline in the inbow Valley areas has decreased markedly ce 1961, probably in response to decreased mpage. Near Gila Bend, water levels have clined from 20 to 60 ft since 1953, but in the rus Valley area north of Theba, water levels ve risen since 1953. In 1965, about 115,000 re-ft of groundwater was pumped for agricultural , and 500 acre-ft was pumped for domestic use. st of the water sampled contained fluoride in ex- s of the recommended limits. The mean annual face-water inflow to the Gila Bend basin for the 60-65 water years was 15,930 acre-ft. During the od of January 1966, about 407,000 acre-ft of ter passed Gillespie Dam, but only about 5,000 acre-ft of water passed Painted Rock m. A large part of the flow loss (150,000 acre-ft) obably went into groundwater storage. Well scriptions, water chemical analyses, and driller's s are tabulated. (Knapp-USGS)

PEAK FLOW REQUIREMENTS FOR SPRINKLER IRRIGATION OF ORCHARDS AS AFFECTED BY SOIL TEXTURE AND PEAK EVAPOTRANSPIRATION,
Department of Agriculture, Summerland (British Columbia).
J. C. Wilcox.
Can J Soil Sci, Vol 49, No 1, pp 39-45, Feb 1969. 7 p, 1 fig, 3 tab, 15 ref.

Descriptors: *Sprinkler irrigation, Consumptive use, Duty of water, Orchards, *Soil texture, *Evapotranspiration, *Water requirements, Cover crops, Irrigation efficiency, Bibliographies, Irrigation systems, Field investigations, Climates, Soil moisture, Soil profiles, Evaporation.
Identifiers: *Irrigation requirement, Evaporimeters.

A scheduling procedure was used in 17 orchards from 1962 through 1965 to determine the peak flow of irrigation water required per unit area of land. Irrigation was by the sprinkler method with portable pipe settings of 12 hours. Peak flow was determined on a steady-flow basis during periods of peak evapotranspiration. Evapotranspiration (ET) was determined with evaporimeters. The texture and the water-holding capacity of the soil were also determined. Highly significant coefficients of correlation were obtained between the peak flow required and (1) percent sand, (2) average ET per day during the period of peak ET, (3) depth of water applied at each irrigation, and (4) length of irrigation interval. High correlation coefficients were also obtained among the factors studies. Regression of percent sand and peak ET on peak flow accounted for 90.6% of the variations in peak flow; regression of depth per application and length of irrigation interval accounted for 84.1%. Peak flow was affected directly by the depth of water applied at each irrigation and by the length of the safe irrigation interval, and indirectly by other factors. (USBR)

ECONOMIC EVALUATION OF PUBLIC IRRIGATION DEVELOPMENT,
Economic Research Service, Washington, D. C.
Clyde E. Stewart.
Economics and Public Policy in Water Resource Development, Ames, Iowa State University Press, 1965, pp 107-126, 20 pp, 2 tab, 5 ref. Edited by S. C. Smith and E. N. Castle.

Descriptors: *Water resources development, *Pricing, *Evaluation, *Irrigation, *Decision-making, River basin, Resources, Value, Budgeting, Measurement, Full employment, Soil classifications, Capital, Land, Reclamation.
Identifiers: *Primary agricultural development, *Price projections, *Residual approach, *Data, *Quantification, Discounting, Opportunity costs, Factor process.

This article points to a basic quantification problem in the description and measurement of physical resources for evaluation purposes. This problem is due to a lack of fully developed soils classification, a lack of availability of measurements of water supplies and efficiencies under farming conditions, and a lack of adequate production functions for various land and water situations. All of these inadequacies place severe initial restrictions on evaluation of water development and use. Although government participation in water resource development helps to fill the inadequacy of the market and pricing system, acceptance of market prices in their entirety may hinge on the goals of government activity; these goals are not yet clearly stated. Procedures and analytical techniques evolve from legislation, and public goals reflected in such legislation may actually be in conflict with over-all decision making in terms of resource investments. Goals specified for a program may not be relevant to a rigid opportunity-cost view of resource alternatives. Apparently, then, quantification for evaluation purposes is modified by purposes and goals. But resource evaluation analysis is an effective screening device and a necessary element in decision-making. (Murphy-Rutgers)

FORMATION OF FLOOD PLAIN LANDS,
Army Engineer District, New Orleans, La.
Walter C. Carey.
ASCE Proc, J Hydraul Div, Vol 95, No HY3, Pap No 6574, pp 981-994, May 1969. 14 p, 7 fig, 11 ref.

Descriptors: *Flood plains, *Alluvial channels, *Rivers, *Geomorphology, Sedimentation, Erosion, Meanders, River training, Sediment load, Stream stabilization, Eddies, Turbulence, Streamflow, Deposition (Sediments).
Identifiers: Flood plain formation.

Alluvial rivers migrate laterally and longitudinally and generate new flood plain lands. Lands are formed by sheet accretion, point bar accretion, eddy accretion and back-swamp accretion. The type of flood plain land generated is determined by the nature of the local river migration or movement. With river migration, caving banks are formed, and under certain conditions, the caves can be very sudden, extensive, and dangerous to man in developed or urban areas. (Knapp-USGS)

TREND-SURFACE ANALYSIS OF THE B AND RANGE PROVINCE, AND S GEOMORPHIC IMPLICATIONS,
Geological Survey, Washington, D. C.
Lawrence K. Lustig.
Geol Surv Prof Pap 500-D, 1969. 70 p, 46 tab, 58 ref.

Descriptors: *Geomorphology, *Drainage pat (Geologic), Drainage density, River basins, sion, Geologic control, Hydrogeology, Sedime basins (Geological), Topography.
Identifiers: *Basin and Range province, Weste S.

An attempt is made to examine quantitativel existing regional topographic variations o Basin and Range province. The area of rang total area, range length, range width, range h range relief, range volume, cumulative leng trends, cumulative deviation of trends, range to length, range width to height, and range l to height are used for this purpose. Manual touring, relative-entropy function, Fourier ana and trend-surface analysis were used to an data. Relief ages are not identical with radiom dates because radiometric dates do not gen coincide precisely with dates of orogenic ac throughout the Basin and Range region. present regional topographic variations coi well with the known distribution of historic geologic tectonic events and with the distrib of Precambrian and lower Paleozoic outcro general, alluvial fans are more abundant in with large average values of range width, le height, relief, volume, and area of ranges to area, whereas pediments predominate in areas where these values diminish. Weath predominates on the steep mountain f whereas fluvial processes predominate in drainage basins. It is suggested that reg drainage distinctions are compatible with the graphic, relief age, and fan-pediment distinc because each is a function of time. The numbe drainage systems and their order numbers function of the range size in the absence of straints of shape and lithology. Drainage sy should accord with the steady state predicte stochastic models and by hydraulic principles older and smaller ranges of greater tectonic st

it may not yet have achieved this state within ounger and larger ranges. Trend-surface maps de a basis for examination of such drainage ctions within the Basin and Range province. pp-USGS)

STAGES AND DISCHARGES OF THE MISSISSIPPI RIVER AND TRIBUTARIES IN THE ST. LOUIS DISTRICT, 1965.
Corps of Engineers, St. Louis, Mo.

Corps Eng Basic Data Rep, 1966. 139 p, 1 map, 2 tab, index.

Descriptors: *Discharge (Water), *Mississippi River, *Data collections, *Missouri, Streamflow, Stage-discharge relations, Hydrologic data, Stream gages, Discharge measurement.
Identifiers: St. Louis (Mo).

The results of stage and discharge measurements made on the Mississippi River and its tributaries, principally in the St. Louis District, during the 1965 Calendar Year are tabulated. The data comprise a brief station description, a tabulation of daily stages and, where determined, mean daily discharges. A total of 95 stations are included. Data for 12 stations were furnished by other districts or other Government agencies. Twelve gages were established and 3 were discontinued during the year. The gage readings are water-surface elevations expressed in feet with reference to a zero elevation referred to mean sea level. The datum used is that of the 1929 General Adjustment. The time of gage readings is expressed in Central Standard Time. The river mileage as listed for each station on the Mississippi River is measured from the confluence of the Mississippi and Ohio Rivers; for tributary stations, from the mouth of the respective tributary. A STUDY OF THE SPECIFIC YIELD IN LAND-DRAINAGE SITUATIONS,
Agricultural Research Council, Cambridge (England). Unit of Soil Physics.
A. G. Dos Santos, Jr, and E. G. Youngs.
J Hydrol, Vol 8, No 1, pp 59-81, May 1969. 23 p, 11 fig, 24 ref.

Descriptors: *Specific yield, *Soil water, *Drainage, Gravitational water, Porosity, Permeability, Specific retention, Water storage, Percolation, Infiltration, Aquifers.
Identifiers: Soil air content.

From the definition of the specific yield in an unconfined aquifer, it is shown that the true specific yield is a function of the horizontal position and time and may be obtained from the measurements of localized fluxes and localized water-table movements. With the assumption of vertical flow above the water table, the specific yield is derived as the sum of the air content at the surface and the ratio of the rate of change of the volume of water held in the moisture profile above the water table to the rate of rise or fall of the water table. Since the latter ratio can be small in certain circumstances, the air content at the surface by itself is often a fair approximation to the specific yield. Results of measurements of all the specific yields, obtained in non-steady state drainage experiments using a completely permeable drain installation and a plastic drain installation in a hydraulic model sand tank, are presented. With the use of a virtual specific yield given by the air content at the surface in the midplane position between drain lines, calculated assuming steady state conditions with a stationary water table height and drain discharge for a given drain installation, rise and decay curves for the water table are calculated and compared with experiment, and fair agreement found. A STOCHASTIC MODEL OF MONTHLY RESERVOIR STORAGE,
City Univ., London (England).
C. Venetis.
Water Resources Research, Vol 5, No 3, pp 729-734, June 1969. 6 p, 14 ref.

Descriptors: *Markov processes, *Stochastic processes, Reservoirs.
Identifiers: *Stochastic model, *Monthly reservoir storage, Autoregressive process, Markov Chain, Normality.

In this paper the reservoir inputs are assumed to be generated by a stochastic process. It is further assumed that the autoregressive process (continuous state space) can be adequately approximated by a finite Markov chain. The reservoir content will be treated as a finite Markov chain, conditional and nonhomogeneous. An expression giving the limiting distribution for each month is derived. It is noted that normality of the process is not essential to the model. A simple numeric example illustrates the application of the theory of monthly storage to practical problems. (Loeb-Rutgers)

ANALYSIS OF SMALL WATER MANAGEMENT STRUCTURES IN IRRIGATION DISTRIBUTION SYSTEMS,
Gaylord V. Skogerboe, Wynn R. Walker, Brent B. Hacking, and Lloyd H. Austin.
Research Project Summary Technical Completion Report WG-55-1, June, 1969. 38 p, 150 ref. Utah State University, Logan, Utah Water Research Laboratory. OWRR Project B-012-UTAH.

Descriptors: Hydraulic design, *Hydraulic structures, *Irrigation design, *Water distribution (Applied), Hydraulics, Irrigation engineering, Irrigation systems.

The Irrigation and Drainage Research Conference conducted at Utah State University (ASCE, 1964) delineated many of the research needs regarding 'Small Low-Cost Hydraulic Structures for Conveyance and Distribution Systems,' which was one of the six topics considered at the conference. In discussing possibilities for accomplishing the recommended research, it was suggested by some panel members that a considerable portion of the work could be undertaken by graduate students, particularly at the Master of Science level. The intent of this report has been to sort through the large volume of literature in an attempt to define the specific research needs regarding small water management structures used in irrigation distribu-

UNIVERSITY OF ILLINOIS-CHAMPAIGN

tion systems. In particular, the emphasis has been to develop specific research topics which could be accomplished as a thesis by a graduate student at the Master of Science level.

DEVELOPMENT OF DRAINAGE ASSESSMENT PROCEDURES BASED ON PHYSICAL FEATURES IN ILLINOIS,
Illinois Univ., Urbana. Water Resources Center.
Benjamin A. Jones, Jr., and Carroll J. W. Drablos.
Research Report No 19, Water Resources Center, University of Illinois, May 1969, vi+ 27 p, 3 fig, 4 tab, 33 ref. OWRR Project A-011-ILL.

Descriptors: *Drainage, *Assessments, *Benefits, Drainage districts.
Identifiers: Physical features.

The objectives of this study were to identify the physical features of the land in a drainage district which influence benefits accruing from drainage improvements, and to formulate a method for distributing assessments based upon the relative importance of these physical features. The significant physical features discovered on the study were: (1) the distance from the tract of land to the main drain, (2) the distance from the tract of land to the main outlet, and (3) the permeability of the soil on the tract of land. An equation was developed to determine the assessment for any tract: An= 1.4845 - 0.3476 (Ln/L*) - 0.4680 (Dn/D*) 0.4434 Kn/K*). The equation provides a procedure to equitably distribute drainage assessments with a savings in time. This unbiased procedure should reduce the present objection of landowners of unfair assessments based upon personal judgment. Although the present equation is limited to the geographic area that supplied the data for the coefficients, the procedure developed may be used to calculate coefficients for other soil and morphological areas. 4B. Groundwater Management

NATURAL STORAGE TANKS USED TO REFILL THE THAMES RIVER,
Water and Sewage Works, Chicago Ill.
F. C. Livingstone.
Water and Sewage Works, Vol 116, No 6, pp 208-212, June 1969. 5 p, 4 fig, 1 tab.

Descriptors: *Low-flow augmentation, *Regulation, *Boreholes, Waste dilution, Water allocation (Policy), Water distribution (Applied), Groundwater, Water wells, Recharge, Water levels, Pumping, Water yield, Water storage, Storage tanks.
Identifiers: Thames River (England).

A plan is proposed to supplement the low flow of the Thames River, England with groundwater pumped from chalk beds in the Thames Basin. It is calculated that 340 mgd may safely be withdrawn from 248 wells, which can be drilled at a total cost of less than $20 million. The average annual rainfall in the Thames catchment is 28.84 inches, and in the period of record it has varied from 17.8 in. to 40.8 in. Annual runoff averages 9.6 in. Test holes and aquifer tests show that the amount of water available is enough to increase summer low flow to significantly reduce pollution, and groundwater levels will be lowered enough to increase winter wet period infiltration to greatly reduce high flows. AN APPRAISAL OF THE GROUND-WATER RESOURCES OF THE SUSQUEHANNA RIVER BASIN IN NEW YORK STATE,
Geological Survey, Washington, D. C.
Este F. Hollyday.
Geol Surv Open-file Rep, Mar 1969. 52 p, 5 fig, 5 tab, 20 ref.

Descriptors: *Water resources, *Groundwater, *New York, Aquifers, Glacial drift, Water wells, Water quality, Water yield, Recharge, Water levels, Groundwater basins, Hydrogeology.
Identifiers: *Susquehanna River Basin (NY).

A survey was made of the groundwater resources of the Susquehanna River Basin in New York. The area's major aquifers are Pleistocence outwash. Yields are as high as 2,000 gpm at a cost of about 5 cents per 1000 gal. The quality of most water from the outwash is excellent. There is no present or foreseeable future water shortage in the basin; local problems may arise because of improper management or well locations. Some water from the bedrock contains excessive iron and chloride concentrations. A few samples of water from outwash contain too much iron, and all groundwater in the area is extremely hard. P. G. Fookes, and J. L. Knill.
Eng Geol, Vol 3, No 2, pp 81-120, Apr 1969. 40 p, 33 fig, 4 tab, 14 ref.

Descriptors: *Groundwater, *Water wells, *Aquifers, Alluvium, Tunnels, Groundwater basins, Water resources development, Water yield, Water levels.
Identifiers: *Iran, Qanats.

As in most arid environments, the availability and distribution of water in Iran has been the major factor in determining past regional development. The groundwater resources of the basins have been developed for a considerable period of time by the traditional, but very effective, systems of qanats. The futher exploitation of groundwater, therefore, requires careful evaluation of the manner in which modern methods of abstraction can be combined within existing patterns of usage. In those areas marginal to mountainous regions the integrated use of ground and surface water resources may be of considerable importance. Three case histories illustrate different facets of groundwater development in northern Iran grading from mountain to plain environments. In the more central areas, where qanats, tens of kilometers in length, are used to supply isolated desert villages, deep tube wells are replacing this ancient system because of their speed of construction and ease of maintenance. APPLICATION OF AN ELECTRONIC A COMPUTER TO THE EVALUATION O EFFECTS OF URBANIZATION OF TH NOFF CHARACTERISTICS OF WATERSHEDS,
Utah Water Research Lab., Logan.
V. V. Dhruva Narayana, and J. Paul Riley.
Symp on Use of Analog and Digital Comp Hydrol Tucson, Ariz, Dec 1968, Int Ass Sci Pub No 80, Vol 1, pp 38-48, 1968. 11 p, tab, 5 ref.

Descriptors: *Analog computers, *Analog *Model studies, *Urbanization, *Rainfal relationships, Hydrographs, Hydrograph Storm runoff, Paving, Land use, Infiltration
Identifiers: *Urban hydrology, *Austin Waller Creek, Equivalent rural watershed.

In the synthesis of hydrograph character small urban watersheds, the distribution water among the various phases of the process is attempted by the concept of 'Eq Rural Watershed'. The criteria for transfor urban watershed into an equivalent rural w require that, for a given input into both the the outputs must be identical. The hydro

ow from an urban watershed is obtained by nologically deducting the losses due to inter-on, infiltration and depression storage from pitation on the equivalent rural watershed and routing it through the surface and channel ges. This is accomplished with the analog puter at the Utah Water Research Laboratory, State University at Logan. Testing and verifi-n is done with rainfall and runoff data from the er Creek watershed at Austin, Texas. In the cation process, coefficients representing in-ption, depression storage and infiltration are mined by trial and error so that the simulated graph is nearly identical to the measured graph of the prototype. The variation in the s of these coefficients from year to year is as-d to be due to the corresponding variations in haracteristics of urbanization defined by the ntage impervious cover and the characteristic vious length (ratio of the mean length of between the center of the impervious area he discharge measuring point to the maximum n of travel on the watershed. (Knapp-USGS) 07951

E ECONOMIC ASPECTS OF URBAN SEDI-TATION,
urces for the Future, Inc., Washington, D. C.
rt K. Davis, and David B. Brooks.
Economics, Vol. 43, No. 3, pp 312-319, Au-967. 8 p, 20 ref.

riptors: *Third party effects, *Sedimentation, development, Rural areas, Economics, Ac-ted erosion, Runoff, Sediment control, Strip .
ifiers: *Urban areas, Public control measures.

e effects of sedimentation violate a prime as-tion of the pure market system-that each mic actor is accountable for the con-nces of his own actions. The problem is con-d for both rural and urban areas. Urban sedi-ation presents a clear case of third party ef-It is largely caused by accelerated erosion (1) the vast exposure of raw soil at construc-ites, and (2) the extremely high peak runoff caused by the high proportion of roofed and land in urban watersheds. A large share of party losses are damaged recreational and tic values. Private economic incentives will lleviate the problem. There are major gaps in nowledge of the technical and economic ef-of public control measures, gaps that are criti-ot just for the design of efficient control ns but even for predicting whether sediment tion will improve or impair water quality. al alternative public actions are evaluated. procedures and regulations that coal strip s must follow in several states suggest an ap-h for urban land management. Land develop-should be compatible with the topography rainage system of a site. (Gossen-Chicago) 08110

citation of problems connected with the ge of movement of water and sediment in m systems leads to the conclusion that these ems arise as a natural result of the change of the water-sediment regime. Costs of solving the problems should be considered in evaluating benefits occasioned by the original actions. Sometimes cause and effect relations are not understood by decision makers. A method of farming on flatland may be undesirable when applied to sloping ground. Diverting stormflow from city streets to natural watercourses may be harmful. Breaching a power dam filled with sediment will cause filling of channels downstream. Responsibilities of engineers studying the sedimentation problems involved in civil engineering works are threefold: (1) identifying the problem and forecasting the nonbeneficial effects of the solution; (2) designing projects with desirable purposes to mitigate the undesirable effects, and when this is not possible; (3) providing measures for controlling the undesirable reaction to an action for a desired purpose. The engineer is always confronted with the necessity of recognizing the entire problem, preparing a suitable plan for accomplishing a specific purpose, and assessing all costs involved in the plan. 05. WATER QUALITY MANAGEMENT AND PROTECTION

5A. Identification of Pollutants

NUCLEAR METHODS IN AIR AND WATER POLLUTION ANALYSIS,
Louisiana State Univ., Baton Rouge.
Frank A. Iddings.
Environ Sci Technol, Vol 3, No 2, pp 132-140, Feb 1969. 9 p, 9 fig, 1 tab, 15 ref.

Descriptors: *Tracers, Radioactivity, *Radioactivity techniques, Air pollution, Radioactive decay, Radiochemical analysis, Radiochemistry, *Radioisotopes, Radiation measurement, *Chemical analysis, Chemistry, Gamma rays, Water analysis, Water pollution, Nuclear meters, Measuring instruments, Instrumentation, Quantitative analysis, Bibliographies.
Identifiers: *Radioactive tracers, Radionuclides, Radiation detectors, Nuclear radiation, Activation analysis.

Nuclear methods are well suited for air and water pollution analyses. Advantages are high sensitivity, specificity, relative freedom from interference, rapid and simple analysis, and low cost. Disadvantages include scarcity of trained technicians, adverse public reaction to nuclear methods, and availability of the proper tracer. Radioactivity and detection devices are summarized. Basic principles and applications are discussed for the following nuclear techniques: isotope dilution, radiorelease, radioisotope derivative analysis, radiometric titration, study of analytical chemistry methods, tracing, radiation absorption, and activation analysis. The brightest prospects for nuclear methods are in chemical analyses method studies and automation of analyses. Limited quantities of radioisotopes are available for studying analytical methods without a specific AEC license. General license quantities of radioactive isotopes are given. (USBR)

EVALUATION OF THE PYRIDINE-ALKALI COLORIMETRIC METHOD FOR DETERMINATION OF ATRAZINE,
Wisconsin Univ., Madison. Dept. of Soils.
R. O. Radke, D. E. Armstrong, and Gordon Chesters.
J Agr Food Chem, Vol 14, No 1, pp 70-73, Jan-Feb 1966. 2 fig, 3 tab, 10 ref. WP 00751-01.

Descriptors: *Colorimetry, *Analytical techniques, *Chemical analysis, *Herbicides, Degradation (Decomposition), Hydrogen ion concentration, Soil chemistry, Temperature, Water chemistry, Water pollution sources.
Identifiers: *Atrazine, Beer's law, 2-chloro-4-ethylamino-6-isopropylamino-s-triazine, 2-chloro-s-triazines, Hydroxtriazine, Perfusion, Propazine, Pyridine-alkali method, Pyridine-alkali-ethyl cyanoacetate method, Semazine.

An evaluation of the pyridine-alkali and pyridine-alkali-ethyl cyanoacetate techniques for the colorimetric determination of atrazine (2-chloro-4-ethylamino-6-isopropylamino-s-triazine) showed that color intensity was influenced by the pH of the system and temperature of reaction of the atrazine-pyridine complex with alkali. Color intensity increased with increased acidity and a suitable temperature for color development is 20 plus or minus 2 deg Celsius. The sensitivity of the pyridine-alkali-ethyl cyanoacetate method was 0.02 parts-per-million with a precision of plus or minus 1.5%. Either technique is adaptable to other 2-chloro-s-triazine herbicides. (Armstrong-Wisc)

THE PHYSIOLOGY OF THE COLIFORM GROUP,
Robert A. Taft Sanitary Engineering Center, Cincinnati, Ohio. Div. of Water Supply and Pollution Control.
Harold F. Clark, and Paul W. Kabler.
Proc Rudolfs Res Conf, Rutgers Univ, New Brunswick, NJ. Principles and Applications in Aquatic Microbiology, Heukelekian, H and Dondero, Norman C (eds), John Wiley and Sons, Inc, New York, pp 202-229, 1964. 1 fig, 2 tab, 52 ref, disc.

Descriptors: *Bacteria, *Coliforms, *Pollutants, Sanitary engineering, Water, Foods, Soils, Gases, Hydrogen, Carbon dioxide, Fermentation, Plants, Cattle, Grains (Crops), Biochemistry, Microorganisms, Milk, Acid bacteria, Carbohydrates, Physiochemical properties, Animals, Statistical methods, Birds, Human diseases, Sheep, Geographical regions, United States, Inspection, Spores, Hydrogen sulfide, E coli.
Identifiers: *Physiology, *Bacillus coli, Taxonomy, Health, Aerobacter aerogenes, Feces, Glucose, Morphology, Bacterium coli, Bacterium aerogenes, Motility, Coli communis, B lactes-aerogenes, Sucrose, Lactose, Dulcitol, Raffinose, Mannitol, Methyl, Indole, Tryptophan, Ehrlich reaction, Vibrio cholera, Pigs, Types, Acetylmethyl-carbinol, Citrate, Uric acid, Cellobiose, Liquefaction, Eijkman test.

Although the methodologies for distinguishing between the coliform strains of fecal and non-fecal origin are adequate for pollution, the perfect test has not been developed. The gas ratio (Hydrogen:Carbon dioxide) differential test seemed to solve the problem of differentiating the coliform bacteria of fecal origin from those of plant or soil origin but was unadaptable as a routine method. As laboratory procedure, the methyl red test was recommended as of equal value. Since certain assumptions were not valid, its use as a reference procedure was rejected. The property of producing indole from tryptophan has been extensively applied. The indole reaction by coliform bacteria from feces of warm-blooded animals is generally positive in excess of 90 percent, although approximately one-fifth of the coliform bacteria from unpolluted soils can also produce indole. The Voges-Proskauer test, traditionally used as a taxonomic characteristic, is useful in separating fecal from non-fecal coliform group when the data are interpreted statistically. The citrate utilization

LIBRARY U. OF I., URBANA-CHAMPAIGN

reaction is useful, on a statistical basis, for separating fecal and non-fecal types. The tests, methyl red, indole, Voges-Proskauer, citrate, none entirely satisfactory individually, combined (IMVIC test), yielded the best classification. The elevated temperature test was superior to other procedures in simplicity. (See Vol. 2, No. 18, Field 5C, W69-07423). (Jones-Wisc)

PROTISTS, PIGMENTS, AND PHOTOSYNTHESIS,
Brandeis Univ., Waltham, Mass. Dept. of Biology.
Jerome A. Schiff.
Proc Rudolfs Res Conf, Rutgers Univ, New Brunswick, NJ. Principles and Applications in Aquatic Microbiology, Heukelekian, H and Dondero, Norman C (eds), John Wiley and Sons, Inc, New York, pp 298-313, 1964. 5 fig, 2 tab, 14 ref, disc.

Descriptors: *Photosynthesis, *Pigments, *Chlorophyll, *Spectrophotometry, *Absorption, *Electron microscopy, Wavelengths, Sun, Light, Plant pigments, Electrochemistry, Plants, Animals, Microscopy, Algae, Thermodynamics, Energy, Ecology, Euglena.
Identifiers: *Protists, Protista, Monera, Chlorella, Scenedesmus, Chlamydomonas, Ulva, Spirogyra, Ochromonas, Nitzschia, Navicula, Coilodesme, Porphyridium, Porphyra, Hemiselmis, Cryptomonas, Cyanidium, Sennia, Tribonema, Monodus, Nitella, Chara, Gonyaulax, Anacystis, Chroococcus, Anabaena, Oscillatoria, Nostoc, Rhodospirillum, Chromatium, Rhodopseudomonas, Chlorobium, Chlorophyll a, Chlorophyll b, Chlorophyll c, Chlorophyll d, Carotenoids, Phycocyanin, Phycoerythrin, Chloroplasts.

Photosynthetic structures of higher plants and photosynthetic bacteria are compared chemically and with both light and electron microscopes. Higher plants, including Protista and Cyanophyta, evolve oxygen during photosynthesis, whereas photosynthesis in bacteria does not involve formation of molecular oxygen. Chlorophyll a has chemical ability to mediate photosynthesis by interacting with other enzymatic cell machinery. The resulting molecule represents a compromise between light-absorbing properties and chemical properties. Accessory pigments with absorption properties different from chlorophyll a, yield fluorescence characteristic of chlorophyll a, and permitting photosynthesis in limited spectrometric regions, increase the amount of energy. This is transferred along a chain of accessory pigments resulting, eventually, in chlorophyll a. Organisms occur ecologically according to their light-absorbing abilities. All photosynthetic organisms seem to have similar systems for the production of adenosine triphosphate and reduced triphosphopyridine nucleotide but differ in the way they obtain extra electrons. Green plants obtain these from a second photochemical reaction involving water, while with photosynthetic bacteria, they arise from externally added hydrogen sulfide, hydrogen, etc. Photosynthetic bacteria employ a somewhat different pigment from green plants, but the matabolic picture appears remarkably similar and the basic outlines are strongly suggested by the experimental data. (See also Vol. 2, No. 18, Field 5C, W69-07423). (Jones-Wisc)

THE METHANE FERMENTATION,
Stanford Univ., Calif. Dept. of Civil Engineering.
Perry L. McCarty.
Proc Rudolfs Res Conf, Rutgers Univ, New Brunswick, NJ. Principles and Applications in Aquatic Microbiology, Heukelekian, H and Dondero, Norman C (eds), John Wiley and Sons, New York, pp 314-343, 1964. 6 fig, 2 tab, 28 ref, disc.

Descriptors: *Bacteria, *Biochemistry, *Fermentation, *Methane, Acids, Amino acids, Anaerobic conditions, Carbohydrates, Carbon dioxide, Chemical oxygen demand, Chromatography, Decomposing organic matter, Lagoons, Lakes, Manometers, Microbiology, Ponds, Oxygen, Proteins, Sediments, Septic tanks, Sludge, Spores, Streams, Temperature, Tracers, Waste disposal, Yeasts.
Identifiers: Acetic acid, Clostridium, Methanobacterium formicicum, Methanobacterium proprionicum, Methanobacterium sohngenii, Methanobacillus omelianskii, Methococcus mazei, Methococcus vannielli, Methanosarcina barkerii, Methanosarcina methanica, Proprionic acid, Succinic acid.

Methane fermentation, conversion of organic matter to methane and carbon dioxide, was studied with impure or partially purified cultures. 'Acid formers' convert proteins, carbohydrate, and fats to fatty acids by hydrolysis and fermentation. Then methane-producing bacteria utilize the organic acids, converting them into carbon dioxide and methane. Rates of fermentation are dependent on optimum environmental conditions. Radiocarbon studies indicate that fatty acids are fermented by beta oxidation or a similar mechanism with the methane bacteria solely responsible. Fermentation of propionate may be a limiting factor in methane fermentation from fatty acids and carbohydrates. Tracer studies on overall methane fermentation of various carbohydrates indicate acetic acid formation and carbon dioxide reduction. Complex proteins were first hydrolyzed by bacterial enzymes into simple amino acids, then fermented by various pathways, depending upon the organisms involved. Free energy from methane fermentation of organics is low. Generation time required to double the bacterial population is related to minimum sludge retention time. If sludge retention time is decreased below generation time, bacteria will be wasted faster than they reproduce, resulting in failure of the process. It was found that yeast extract and certain other additions decreased the time required for gas formation. (See also Vol. 2, No. 18, Field 5C, W69-07423). (Jones-Wisc)

SOME ASPECTS OF THE BACTERIOLOGY OF THE RUMEN,
Agricultural Research Center, Beltsville, Md. Animal Husbandry Research Div.
Marvin P. Bryant.
Proc Rudolfs Res Conf, Rutgers Univ, New Brunswick, NJ. Principles and applications in Aquatic Microbiology, Heukelekian, H and Dondero, Norman C (eds), John Wiley and Sons, Inc, New York, pp 366-393, 1964. 1 fig, 2 tab, 116 ref, disc.

Descriptors: *Bacteria, *Ruminants, Fermentation, Enzymes, Microorganisms, Protozoa, Metabolism, Habitats, Biochemistry, Anaerobic bacteria, Carbohydrates, Cultures, Cellulose, Amino acids, Sludge.
Identifiers: *Rumen, Alimentary tract, Nutrition, Physiology, Fatty acids, Glycerol, Methanobacterium ruminantium, Veillonella alcallescens, Ruminococcus albus, Bacteroides amylophilus, Butyrivibrio fibrisolvens, Ruminococcus flavefaciens, Selenomonas ruminantium, Streptococcus bovis, Bacteroides ruminocola, Bacteroides succinogenes, Peptostreptococcus elsdenii, Lachnospira multiparus, Succinovibrio dextrinosolvens, Eubacterium ruminantium, Borrelia, Anaerobic lactobacilli, Xylan, Starch, Lactate.

Differing from most bacteria in other natural habitats, rumen bacteria are significant in comparative biochemistry and nutrition. Primarily they ferment carbohydrates; also, they absorb volatile fatty acids as their energy source and hydrolyze protein to amino acids and peptides. Rumen fluid agar media with small amounts of certain carbohydrates were most successful for species culture and colony counts. They are mainly nonsporeforming anaerobes, isolated only from the rumen. Similar species occur in sediments of natural waters and sewage sludge. These differ in that methane is formed in sludge but not in the rumen. The 'rumen fluid' factor required by many cellulolytic bacteria seems to consist of a two-component requirement for volatile fatty acids sti
tory to cellulose digestion and protein syn
under certain conditions. These acids, import
metabolism, may be required. Certain tetrapy
appear to be required mainly for synthesis
cytochrome of the b type. The nitrogen re
ments of many rumen bacteria are quite un
compared to those of heterotrophic bacteria
studied. Most species can be grown with amm
as the main source of nitrogen. Some s
require amino acids; others not. Some species
to utilize ammonia for growth in preference
ganic nitrogen. (See also Vol. 2, No. 18, Fiel

faecalis, Aspergillus niger, Penicillium, Cla

urea, Proteun vulgaris, Streptococcus lactis genes, Proprionibacterium pentosaceum, Clos- m sporogenes, Clostridium tetanomorphum, ridium perfringens. Achromobacter novorum, Pseudomonas aeruginosa, Fungi im- cti, Schizophyllum commune, Scopulariopsis caulis, Microsporeum gypseum, Shigella flex- Dissimilation, Interconversion.

nic sulfur compounds show marked dif- ces in susceptibility to microbial attack. tases of bacteria, fungi, and animal and plant bring about the cleavage which results in uction of sulfate by hydrolysis. Dissimilation of ne and cysteic acid by fungi, bacteria, and ac- nycetes resulted first in release of nitrogen as onia and sulfur as sulfite, then oxidized to te. Dissimilation of cyst (e)ine produces sul- also elemental sulfur and sulfate. In decom- ion, although sulfur in the cysteine is in a ced state, the inorganic sulfur product need e a highly reduced compound. Only one initial kdown product from methionine consistently rted is methyl thiol. Cultures grown in a simple ral salts medium containing methionine as the organic substance were all similar, Gram- tive, non-sporulating bacteria. The only ucts formed were methyl thiol and dimethyl fide. Aspergillus sp gave results similar to of the bacteria, differing in that it did not in a medium with methionine the only organic rial. Interconversion of methionine and ine has been established. Although the organisms may be able to fulfill their require- s for each amino acid from the other, the dis- lation reactions proceed without any change e other amino acid. (See also Vol. 2, No. 18, 5C, W69-07423).

DIALYSTAT: NEW SAMPLER FOR DIS- VED ORGANIC MATTER,
nington Univ., St. Louis, Mo. Dept. of Botany.
e C. Parker.
nology and Oceanography, Vol 13, No 4, pp 723, Oct 1967. 1 fig.

riptors: *Organic matter, *Sampling, Analyti- echniques, Aquatic environments, Dialysis, r chemistry, Water pollution sources.
ifiers: *Dissolved organic matter, *Biodialy- Cyanocobalamine, Millipore filters.

biodialystat is a device for collection of cell- water for its content analysis of dissolved or- matter. The sampler is essentially a chamber h is placed in situ and which functions by per- ng dialysis of ambient natural water against ized distilled water contained in the chamber. librium time must be standardized for each ound of interest. Cobalamine, for which or has used the biodialystat, reaches maximum entration after 24-36 hours in lake water at 0 degrees C. Tested with millipore membrane e diameter 0.2 micron) in sewage sludge, plankton cultures, and lake water, device ined impervious to microorganisms for at least days. Author lists following advantages for ler: eliminates local chemical differences in tic environments; eliminates need for protec- of samples against biological changes between ction and analysis; eliminates errors due to tions in method for removal of seston; uces more reliable estimates of dissolved sub- ces than do filtration methods. A bill of materi- nd a photograph of the device is included in eport. (Eichhorn-Wisc)

THE INFLUENCE OF SALTS APPLIED TO HIGHWAYS ON THE LEVELS OF SODIUM AND CHLORIDE IONS PRESENT IN WATER AND SOIL SAMPLES,
Maine Univ., Orono. Dept. of Plant and Soil Sciences.
Frederick E. Hutchinson.
Maine Univ Project Completion Report, June, 1969. 18 p, 9 tab, 2 fig, 6 ref. OWRR Project A-007-ME.

Descriptors: Pollutant identification, *Saline soils, Soil-water relationships, Chlorides, Impaired water quality.

This research project was conducted to determine the effect of salt application to de-ice highways on the sodium and chloride levels in (1) streams and rivers, (2) private water supplies contiguous to highways and (3) soils bordering highways. Analyses of seven rivers in Maine from six samplings over a two-year period indicate that sodium and chloride concentrations are not affected by highway salting; since the level of both ions remained consistent throughout the period. Although the concentrations of both ions tended to increase from the headwaters to the mouth of the rivers, the average concentrations for 27 sites were 3.4 and 1.5 ppm for sodium and chloride, respectively. Semiannual analyses of 100 randomly selected wells along Maine highways indicate that levels of sodium and chloride are much higher than normal, averaging 69 and 162 ppm, respectively. Twenty-five percent of the wells were unfit for potable supplies because they contained in excess of 250 ppm of chloride. Sodium and chloride levels in soils contiguous to highways bear a direct relationship to the length of time over which highways have been salted. In areas where salt has been applied for 20 years the sodium levels have risen over a distance of 60 feet from the edge of the highway and to a depth of 18 inches. Sodium saturation of the soil approaches 15% at some sites, and chloride levels in the soilwater system ranged from 10 to 2525 ppm, thereby producing the equivalent of an 'alkali' condition.

5B. Sources of Pollution

REDUCTION OF RIVER HEAT POLLUTION BY TURBULENCE STIMULATION,
Sacramento State Coll., Calif. Dept. of Civil Engineering; and Connecticut Univ., Storrs. Dept of Civil Engineering.
Alan L. Prasuhn, and Victor E. Scottron.
Conn Univ School Eng Rep No 69-22, May 1969. 17 p, 6 fig, 23 ref. OWRR Proj No A-011-CONN.

Descriptors: *Thermal pollution, *Water pollution control, *Turbulence, *Mixing, Dispersion, Diffusion, Water temperature, Surface waters, Streamflow, Mathematical models.
Identifiers: Turbulence stimulation.

A wind tunnel study was made of a two-dimensional, heat stratified flow. A mathematical model was developed and compared with measured temperature profiles for flow over both smooth and rough boundaries. Increased turbulence greatly accelerated the mixing rates. The possibility is suggested that artifically induced turbulence might enhance mixing and stream temperature control. (Knapp-USGS)

A SURVEY OF HEAT SINK CAPACITY OF MAJOR STREAMS WITHIN THE U. S.,
Battelle-Northwest, Richland, Wash. Pacific Northwest Lab.
K. R. Wise, and B. M. Cole.
Battelle Mem Inst Pacific Northwest Lab Rep No 951, Jan 1969. 61 p, 2 fig, 2 tab, 8 ref, 2 append.

Descriptors: *Cooling water, *Thermal powerplants, *Streamflow, Water temperature, Surveys, Water quality control, Water quality act, Regulation, Water pollution control, United States.
Identifiers: Streamflow-temperature surveys, Water quality standards.

Data are presented indicative of the limitations of the cooling water supply in the nation. As an index of cooling potential for each major stream, heat input for a 1 deg F temperature rise, with the minimum monthly average flow recorded in a 10 yr period, is used. Based on this characteristic of the streams in the U.S. locations are identified on a regional basis, where alternative solutions to once-through cooling can be anticipated first. Water quality standards will also affect cooling water availability and an attempt is made to identify the potential impact of these standards. (Knapp-USGS)

Identifiers: *Analog computer simulation, Compartment models, Environmental radioactivity, Analog computer techniques.

Analog computers may be used to simulate movements of stable carbon and carbon-14 between compartments in ecosystem models. Simulation is achieved through solution of appropriate systems

LIBRARY U. OF I., URBANA-CHAMPAIGN

of linear differential equations. When an analog model representing a four-compartment terrestrial ecosystem is used to describe the build-up and movement of carbon in the system, a series of linear lags in the approach of each compartment toward a steady state is observed. Similar results are obtained for carbon-14. However, analog techniques need not be restricted to simple ecosystem simulation. The same methods and combinations of analog computer components can be used for either simple or complex ecosystems. By considering more detailed compartment models and describing ecosystems with either linear (including variable-coefficient) or non-linear systems of differential equations, very complex ecosystems can be examined in detail. TRACER STUDY OF THE PHOSPHORUS CYCLE IN SEA WATER,
Dalhousie Univ., Halifax (Nova Scotia). Inst. of Oceanography.
W. D. Watt, and F. R. Hayes.
Limnol Oceanogr, Vol 8, pp 276-285, 1963. 8 fig, 3 tab, 18 ref, disc.

Descriptors: *Cycling nutrients, *Phosphorus compounds, *Sea water, *Tracers, Bacteria, Chromatography, Cyanophyta, Diatoms, Decomposing organic matter, Ecosystems, Enzymes, Equilibrium, Eutrophication, Lakes, Phosphorus radioisotopes, Plankton, Water chemistry, Water pollution effects, Water pollution sources, Zooplankton.
Identifiers: *Phosphorus cycle, Comparative studies, Daphnia magna, Dynamic equilibria, Dissolved inorganic phosphorus, Fucus vesiculosus, Gammarus, Halifax, Nova Scotia, Millipore filtration, Nostoc, Paper chromatography, Particulate phosphorus, Phosphatases, Skeltonema, Turnover times.

The biological exchange of phosphorus between dissolved inorganic phosphorus (DIP), particulate phosphorus (PP) and dissolved organic phosphorus (DOP) fractions was studied by adding DIP-32 to sea water and following the amounts of P-32 in each of the three fractions with lime, steady-state conditions were assured. A rapid decline in DIP-32, a rapid increase in PP-32 and a relatively slow increase in DOP-32 were observed. The main exchange processes were concluded to be DIP with PP and PP with DOP. Because addition of DOP-32 to sea water resulted in more rapid accumulation of PP-32 than DIP-32, direct conversion of DOP to DIP was believed not to occur. Exchange rates (micrograms-atoms P/liter/day) measured in coastal water from near Halifax, N S, Canada, were 0.23 between DIP and PP and 1.2 between PP and DOP. Amounts of P in the DIP, PP and DOP fractions for this site were 0.35, 2.98, and 0.60 micrograms-atoms P/liter, respectively. The DOP-32 fractions were resolved by paper chromatography into six components. (Armstrong-Wisc)

SOIL DEGRADATION OF DIAZINON, A PHOSPHOROTHIOATE INSECTICIDE,
Wisconsin Univ., Madison. Dept. of Soils.
J. G. Konrad, D. E. Armstrong, and G. Chesters.
Agronomy J, Vol 59, pp 591-594, Nov-Dec 1967. 3 fig, 3 tab, 10 ref.

Descriptors: *Degradation (Decomposition), *Insecticides, *Diazinon, *Phosphorothioate pesticides, *Soil chemistry, Adsorption, Hydrolysis, Water pollution sources, Soil contamination, Pesticide residues, Organic matter, Hydrogen ion concentration, Wisconsin, Toxicity.
Identifiers: 2-isopropyl-4 methyl-6 hydroxypyrimidine, Diethyl thiophosphoric acid, Poygan sicl soil, Kewaunee c soil, Ella 1s soil.

Degradation of the insecticide diazinon was followed in acid soil-free systems and in soil systems. The mechanism of diazinon degradation in soils is a partial chemical hydrolysis with formation of 2-isopropyl-4-methyl-6-hydroxypyrimidine and diethyl thiophosphoric acid; hydrolysis in soils is adsorption catalyzed rather than acid catalyzed. Degradation rates were 11, 7, and 6% per day for three Wisconsin soils: Poygan sicl, Kewaunee c, and Ella 1s, respectively; these rates were related to organic matter content and pH of the soil. CHLORINATED HYDROCARBON PESTICIDES IN CALIFORNIA BAYS AND ESTUARIES,
California State Dept. of Fish and Game, Menlo Park. Marine Resources Operations.
John C. Modin.
Pesticides Monit J, Vol 3, No 1, pp 1-7, June 1969. 7 p, 1 fig, 6 tab, 7 ref.

Descriptors: *Pesticide residues, *Estuaries, *California, *Fish, Pollutants, DDT, Chlorinated hydrocarbon pesticides, Pesticide kinetics, Water pollution sources, Monitoring, Data collections.
Identifiers: DDD, DDE.

As part of a nationwide program to monitor organochlorine pesticide residues in estuaries, the U. S. Bureau of Commercial Fisheries in January 1966 contracted to the California Department of Fish and Game the responsibility to monitor selected estuaries in California for pesticides. Analyses of oysters, mussles, and clams sampled at points of interest within each estuary revealed DDT, DDD, DDE, dieldrin, and endrin in concentrations from 10 to 3,600 ppb. Calculations are based on the laboratory wet weight of homogenized tissue. In studies of offshore exposure, high levels of DDT, DDD, and DDE were found in a king crab (2,739 ppb) and in ova from a king salmon (668 ppb). Pesticides were also measured in the ova of prawn, flounder, halibut, and sole; of these, halibut ova were the most highly contaminated, with DDE, DDD, and DDT measuring 591 ppb. (Knapp-USGS)

Pesticides Monit J, Vol 3, No 1, pp 8-66, June 1969. 58 p, 5 fig, 31 maps, 9 tab, 2 ref.

Descriptors: *Pesticide residues, *Mississippi River, *Sediments, Silts, Sands, Clays, Pollutants, DDT, Dieldrin, Aldrin, Endrin, Heptachlor, Chlorinated hydrocarbon pesticides, Pesticide kinetics, Water pollution sources, Monitoring, Data collections.
Identifiers: Lower Mississippi River Basin.

Studies of the chlorinated hydrocarbon content of sediments and water from the lower Mississippi River and its tributaries were conducted in 1964, 1966, and 1967 to determine the extent and possible sources of agricultural pesticides in the streams of the Delta. The Mississippi River bed was pled at 11 sites located between Tiptonville, and New Orleans, La. Tributaries of the Miss in the Delta were sampled in Tennessee, Mis pi, Louisiana, and Arkansas. Pesticides re were detected from both agricultural nonagricultural sources: however, no evidenc found of a general buildup of chlorinated hyd bons in the sediments of these streams from use. Diedrin, aldrin, endrin, endrin keto, is chlordane, heptachlor, hexachlorononborna and heptachlorononborbene were found in ment and water samples collected from C Creek and Wolf River at Memphis, Tenn., primary manufacturer of endrin and hepta Lower concentrations of several of these pounds were detected in sediments collected tributary streams in Mississippi near formu plants that prepare the technical pesticid agricultural use. DDT analogs and metal were found in some of the tributary streams no known formulators are located. (Knapp-U

RURAL RUNOFF AS A FACTOR IN STR POLLUTION,
Robert A. Taft Sanitary Engineering Center cinnati, Ohio. Cincinnati Water Research Lab R. B. Weidner, A. G. Christianson, and S. R. Weibel.

ter Pollut Contr Federation, Vol 41, No 3, , pp 377-384, Mar 1969. 8 p, 6 fig, 10 tab, 3

iptors: *Water pollution sources, *Runoff, ns, *Farm wastes, Bacteria, Biochemical ox- demand, *Erosion, Phosphates, Nitrogen ounds, Sediments.
ifiers: Rural runoff.

ropped and mixed agricultural watersheds experimental prevailing and improved crop management at Coshocton, Ohio, and an orchard over meadow at Ripley, Ohio, were mented to sample and gage rainfall and storm f from the fields. Under prevailing practices hly volume of runoff from fields was higher hat under improved practices such as contour ng and strip cropping. More runoff developed a field in corn than from one in wheat, and the runoff developed from fields in meadow. correlations between rural runoff silt losses otal solids, and between total solids and BOD, total hydrolyzable phosphate, and total gen were found. Microbial tests showed that acterial sources were predominantly nonhu- but total coliforms exceeded 1,000/100 ml in of the samples in runoff from 2 of the rural sheds. (Knapp-USGS)

ORINATED INSECTICIDES IN RUNOFF TER AS AFFECTED BY CROP ROTATION,
cultural Research Service, Orono, Maine. t. of Plant and Soil Science; and Maine Univ., no. Water Resources Center.
pstein, and W. J. Grant.
Sci Soc Amer Proc, Vol 32, No 3, pp 423-426, -June 1968. 4 p, 6 tab, 20 ref.

Descriptors: *Pesticides, *Runoff, *Rotations, Water pollution sources, Path of pollutants, DDT, Endrin, Gas chromatography.
Identifiers: Crop rotation effects.

The concentration and amounts of 3 chlorinated insecticides were lower in runoff from a rotation system of potato, oats, and sod, than under continuous potato cropping. Runoff samples from natural runoff plots were collected following each storm, and the amounts of DDT, endrin, and endosulfan were analyzed with a gas chromatograph. The amounts of pesticides in runoff were small compared to the amount applied. The concentrations of the insecticides in the runoff (soil-water suspension) were generally greater than those found in the settled soil (sludge). (Knapp-USGS)

THE EFFECT OF PUMPED-STORAGE RESERVOIR OPERATION ON BIOLOGICAL PRODUCTIVITY AND WATER QUALITY,
Virginia Commonwealth Univ., Richmond; and Virginia Polytechnic Inst., Blacksburg.
G. M. Simmons, Jr., and S. E. Neff.
Virginia Polytech Inst Water Resources Res Center Bull No 21, Mar 1969. 47 p, 7 fig, 22 tab, 18 ref. OWRR Project No A-012-VA.

Descriptors: *Eutrophication, *Reservoirs, *Pumped storage, Water quality, Nutrients, Sewage, Water pollution, Reaeration, Aeration, Mixing, Stratification, Thermal stratification, Pumping.
Identifiers: Pumped-storage reservoirs.

Smith Mountain Reservoir, Virginia, a pumped-storage hydrogeneration system, which reached its operating capacity in February 1965, has developed some of the limnological attributes of a mesotrophic lake. The impoundment is rapidly developing the characteristics of older, eutrophic, main-stream reservoirs, despite the recycling of large quantities of water during pump-storage operation. The body of water behaves as a warm monomictic lake. A relatively shallow (5-8m) epilimnion forms during stratification. The metalimnion is nearer the surface in the proximity of the dam during pump-back. The anticipated beneficial effects of the recycling process appear to be limited. Seiche action begun by recycling seems to increase carbon assimilation rates in the vicinity of the dam by eddy diffusion of nutrients across the metalimnion. Seiche activity is restricted by basin morphometry, but its influence can be detected 6.5 mi above the dam. In the lower parts of the impoundment, anaerobic conditions in the hypolimnion were not reached although dissolved oxygen concentrations were severely reduced. In the shallower upper reaches of the impoundment, anaerobic conditions developed by late spring. The highest concentrations of dissolved oxygen were encountered in spring and early summer in the epilimnion. Total coliform counts made at various times in the reservoir also emphasize the quantities of effluents that enrich the upper portions of the impoundment. These counts also point out the self-evident fact that water quality improvement in pump-storage reservoirs depends upon the quality of the water which is recycled. (Knapp-USGS)

PROMISING ANTI-POLLUTANT: CHELATING AGENT NTA PROTECTS FISH FROM COPPER AND ZINC,
Fisheries Research Board of Canada, St Andrews (New Brunswick), Biological Station.
John B. Sprague.
Nature, Vol 220, No 5174, pp 1345-1346, Dec 1968. 1 tab, 10 ref.

Descriptors: *Chelation, *Copper, *Pollution abatement, *Zinc, Bioassay, Brook trout, Lethal limit, Metals, Toxicity.
Identifiers: *Anti-pollution agent, Nitrilotriacetic acid, NTA, Pimephales, Salvelinus.

Copper and zinc are widespread pollutants both in industrial areas (waste spillage) and wilderness areas (mining operations). A chelating agent, nitrilotriacetic acid (NTA) appears to be a promising short-term anti-pollutant. Bioassays involving copper and zinc, alone, in mixtures, and in combination with NTA were carried out on brook trout over periods of ten days. Ten fish were used in each 34-liter bioassay tank (no statement of replications is given), the fish being maintained under conditions otherwise considered optimum for the species. Individual times of death were recorded and lethal thresholds (in milligrams/liter) were obtained for copper (0.05) and zinc (0.75). Thresholds were given a 'toxic unit value' of 1.0. Addition of NTA caused a decrease in toxicity (longer survival of fish) at most concentrations of metals (up to 330 toxic units). NTA chelates at ratios of 1 molecule NTA:1 ion metal and selectively chelates copper before acting upon zinc. NTA is apparently as effective as EDTA and costs less. Tabular material gives selected results of mixed copper-zinc toxicity trials, with and without NTA. (Voightlander-Wisc)

THE GALLOPING GHOST OF EUTROPHY,
New Hampshire Water Supply and Pollution Control Commission.
Terrence P. Frost.
Appalachia, Vol XXXVII, No 1, pp 25-36, June 1968. 1 fig, 4 plates.

Descriptors: *Eutrophication, *Lakes, Glaciation, Urbanization, Domestic wastes, Nutrients, Phosphorus, Algae, Algicides, Harvesting of algae, Environment, Cyanophyta.
Identifiers: *Aesthetic deterioration, *Advanced waste treatment, *Nutrient removal, Agricultural drainage, Appalachian Mountain Club huts, Tegernsee, Germany, Expanding technology, Overpopulation.

The increased influence of man on the environment has caused a change in the definition of eutrophication from a natural aging process of lakes due to topography, degree of fertility, sediment loads from mineral and organic solids, subsurface geology, and weathering, to an accelerated aging due to man's influence. Increasing urbanization along with our changing life style, is suggested as the cause for 'galloping eutrophy.' The effect is the proliferation of algal species, harmless and diversified in small numbers; noxious and confined to profusion of a few hardy blue-green species in overpopulation. The result is aesthetic deterioration, fish kills, septic odors, discoloration of objects

LIBRARY U. OF I., URBANA-CHAMPAIGN

in water, organic debris buildups on bottoms, scums and mats. Suggested methods of control include chemical treatment with algicides or harvesting organisms, but these eliminate symptoms without reaching the causes. Real need is nutrient removal from sewage effluent by a variety of techniques, coagulation (lime or alum), reverse osmosis, ion exchange, electrodialysis, distillation, hydrophonics, and irrigation. Mention is also made of methods and improvements in waste disposal at Appalachian Mountain Club huts and the Tegernsee Recreation area in Germany. Author's conclusion: The heart of the problem lies in unharnessed technology and people pollution. (Ketelle-Wisc)

DIGITAL COMPUTER SIMULATION OF AN ECOLOGICAL SYSTEM, BASED ON A MODIFIED MASS ACTION LAW,
Pennsylvania Univ., Philadelphia. Johnson Research Foundation.
David Garfinkel, and Richard Sack.
Ecology, Vol 45, No 3, pp 502-507, Summer 1964. 4 fig, 2 tab, 26 ref.

Descriptors: *Digital computers, *Ecosystems, *Simulation analysis, Computer models, Computer programs, Ecology, Systems analysis, Trophic level.
Identifiers: *Mass action law, Ecosystem computer simulation, Plant-herbivore-carnivore system, Ecosystem stability analysis, Theoretical ecology, Lotka-Volterra equations, UNIVAC I, UNIVAC II.

Utilizing digital computer, a simulation model was devised for a six-species ecosystem, starting with Lotka-Volterra's mass-action mechanism and introducing modifications as required by ecological reality. Their computer program permits description of the system in terms of species and their interactions, without requiring manipulation of differential equations. Behavior of the simulated ecosystem is in good agreement with reality, and some testable hypotheses emerge. Some properties of the system: Total biomass in the systems determines highest predatory level it will support; two species cannot simultaneously occupy same food-chain position; important stabilizing influences include sufficiently large predator populations, negative feedback controls on reproduction, and presence of immature predators which have food consumption different from adult or which otherwise affect food consumption of adult; and ecosystems may have time cycles of distinct length, resistant to perturbation. While complex mathematical models may not be ecologically valid, and ecologically valid models may not generate ecologically useful results, computer simulation of realistic ecosystems is feasible without requiring undue mathematical effort by user. SEAWEED EXTRACTS AS FERTILISERS,
Portsmouth Coll. of Tech. (England). School of Pharmacy.
G. Blunde, S. B. Challen, and D. L. Woods.
J Sci Food Agric, Vol 19, pp 289-293, June 1968, 1 fig. 8 tab, 26 ref.

Descriptors: *Fertilizers, *Cycling nutrients, Eutrophication, Algae, Plant growth substances, Plant growth, Carbohydrates.
Identifiers: *Seaweed extracts, Ascophyllum nodosum, Alginic acid, Fucus vesiculosus, Growth factors, Laminaria saccharina, Mannitol, Mustard growth test, Organic growth factors, Polysaccharides.

In the mustard-growth test, the growth-promoting effects of aqueous extracts of Laminaria saccharina, Fucus vesiculosus and Ascophyllum nodosum were largely due to the metal cations present, but the effects were modified by organic substances in the extracts. Amino acids and mannitol in seaweed extracts had little effect on plant growth, and compounds extracted with organic solvents were only partially responsible for the modification of the growth-promoting effect. The polysaccharide alginic acid and its salts seemed to be the main organic compounds responsible for reducing the effects of metals and may have competed with the plants by ion exchange for the metals in the extract. THE REACTIONS OF FISH TO WATER OF LOW OXYGEN CONCENTRATION,
University Coll. of Wales, Aberystwyth. Dept. of Zoology.
J. R. Erichsen Jones.
J. Exper Biology, Vol 29, pp 403-415, 1952. 8 fig, 22 ref.

Descriptors: *Behavior, *Dissolved oxygen, *Fish, Brown trout, Minnows, Sticklebacks, Oxygen demand.
Identifiers: *Depleted oxygen, *Dyspnoea, *Swimming reactions, Phoxinus, Salmo trutta, Gasterosteus aculeatus.

The behavior of three species of fish was observed in relation to experimentally induced conditions of low oxygen concentration, the majority of the observations being made on the stickleback. At oxygen concentrations of 2.0 to 3.0 milligrams/liter (mg/1), (temperature 13 C), fish moved easily into areas of low oxygen concentrations, but if remaining there, developed dyspnoea (increased amplitude and frequency of opercular movements) and a random pattern of active swimming. At concentrations below 2.0 mg/1, the response was more rapid, and a definite avoidance response was noted. At concentrations above 3.0 mg/1, results were more variable, with dyspnoea requiring a longer time to develop. At high concentrations, some fish apparently were able to adapt to low oxygen concentrations by increasing the amplitude and frequency of opercular movements. Experiments at higher and lower temperatures yielded the same results, with the response rate varying directly with temperature. The same patterns were noted for Phoxinus and brown trout. Author concludes that random, active swimming, induced by dyspnoea and under the influence of temperature, enables fish to escape areas of low oxygen concentration. (Voigtlander-Wisc)

LIMNOLOGICAL CONDITIONS AND GROWTH OF TROUT IN THREE LAKES NEAR ROTORUA,
Marine Dept., Rotorua (New Zealand).
G. R. Fish.
Proc N Z Ecol Sco, No 10, pp 1-7, 1963. 3 fig, 3 tab, 15 ref.

Descriptors: *Eutrophication, *Growth rates, *Primary productivity, *Rainbow trout, Distribution, Dissolved oxygen, Water temperature.
Identifiers: *Limnological conditions, *New Zealand, *Salmo gairdneri, Lake Okataina, Lake Ngapouri, Lake Okaro, von Bertalanffy curves.

Factors affecting water quality were correlated with growth and population density of trout in three New Zealand lakes. All three lakes stratify and are fed by seepage and surface runoff. Lake Okataina receives no nutrient load in terms of fertilizers and domestic animal sewage, while Lakes Ngapouri and Okaro receive runoff from highly developed agricultural (pasture) land. Secchi disk readings in January were 13.0, 4.0 and 3.6 meters for Okataina, Ngapouri and Okaro, respectively. Estimates of asymptotic length (centimeters) and growth rate (K) were 48.9, 0.09; 23.2, 0.09; 31.0, 0.15, for the respective lakes. Estimated population densities in terms of numbers and weight (transformed to killograms/hectare by abstractor) for the three lakes were: Okataina 13,900, 23.7; Ngapouri 1,500, 23.3; Okaro 720, 16.3. Although differences in growth of trout in the latter two lakes may be related to population density, and the absolute size of the three lakes may be important, it appears that eutrophication resulting from agricultural d
ment has produced an inferior environm
trout in Lakes Ngapouri and Okaro. (Voigt

E BACTERIOLOGY OF INTERFACES,
ns Hopkins Univ., Baltimore, Md. Dept. of
tary Engineering and Water Resources.
rles E. Renn.
c. Rudolfs Res Conf, Rutgers Univ, New Brun-
k, NJ. Principles and Applications in Aquatic
robiology, Heukelekian, H and Dondero, Nor-
C (eds), John Wiley and Sons, Inc, New York,
93-201, 1964. Disc.

criptors: *Bacteria, *Interfaces, Biochemical
gen demand, Boulders, Boundaries (Surfaces),
oms, Emulsions, Films, Foaming, Fouling,
es, Oxygen, Paints, Pipes, Plastics, Rocks,
s, Soil microbiology, Suspensions, Walls,
erproofing, Gages.
tifiers: Rutgers Univ, Woods Hole Oceano-
hic Inst, La Jolla (Calif), Scripps Inst Oceanog-
y, Silicones, Tanks, Zeolites, Atmosphere.

narine studies in the laboratory thin bacterial
s developed on containing walls, and changes in
ratio of surface to volume were related to the
at which oxygen was used. On boats, bacterial
s seemed not to hasten wetting of surfaces, but
r hastening or retarding of attachment of larger
ing organisms was questioned. The interface, a
robiological environment, showed in thin, com-
sed film of rods and cocci gathered on slides
ted on water surface. Fixed surfaces, wetted by
ing water, support films of bacteria and larger
nisms. These mechanisms for purifying waste
er act as stripping systems adsorbing organic
ter and oxidizing it. Heavy sludges appeared in
e-water tanks containing low concentrations of
nic materials. Bacterial slimes, ranging from
ous syrups to rubbery gels, cause clogging in
umidifier sections of air systems. These slimes
mble the dense growth of Sphaerotilus and
lar bacteria in some waste-bearing streams in
ter. The irrigated surfaces of the stream bottom
ave as initial interfaces, but heavy developing
amer growth becomes its own interface. Bub-
in activated sludge treatment serve as inter-
s. Perhaps the affinity of surface-active or-
cs and active bacteria of bubbles aids manipu-
n of activated sludge. (See also Vol. 2, No. 18,
d 5C, W69-07423). (Jones-Wisc)

n, C (eds), John Wiley and Sons, Inc, New
rk, pp 441-452, 1964. 39 ref.

Descriptors: *Aquatic microbiology, *Research and development, *Microorganisms, *Water quality, *Chemical reactions, E coli, Salmonella, Sphaerotilus, Pseudomonas, Azotobacter, Bacteria, Protozoa, Fungi, Actinomycetes, Plankton, Periphyton, Benthos, Biochemistry, Physiological ecology, Nutrients, Tracers, Metabolism, Anaerobic conditions, Ecology, Lakes, Ponds, Cultures, Sampling, Nitrogen fixation, Pollutants, Methane bacteria, Bacteriophage, Soil microbiology.
Identifiers: Aerobacter aerogenes, Vibrio, Bacillus, Bdellovibrio bacteriovorus, Beijerinckia, Media, Special diversity, Industrial raw materials.

In relation to water problems, the potentially fruitful activities toward understanding scientific principles dealing with bacteria, protozoa, fungi, and actinomycetes, are discussed. Composition of bacterial plankton, bacterial periphyton, and benthic bacteria, with their specific biochemical roles, needs study. Adjustment at the species level of microbial populations to chemical or physical changes in environment and their reactions at cellular and molecular levels are significant. Important are: the physiology of the coliform group, apart from the intestinal tract; species composition in different nutrients; greater use of isotope tracer techniques applied to rumen metabolism, benthic decomposition, land anaerobic digestion; certain organic molecules as limiting growth factors; microorganisms surviving and reproducing at low nutrient levels. Long-term programs on ecological significance of bacterial distribution are desirable. An autochthonous flora of lakes and ponds, different in composition from that washed from the soil, may exist. Media and methods of culturing sample collections and preservation of samples require improvement. Studies of particular genera or species are beneficial in that studies of this type lead to more concentrated, intelligible results. Nitrogen-fixing bacteria in association with aquatic plants, the role of Bacillus species in pollution, more work on methane-forming bacteria, a small vibrio behaving like bacteriophage--all are challenging. (See also Vol 2, No 18, Field 05c, W69-07423). (Jones-Wis)

MODELING THE BEHAVIOR OF RADIONUCLIDES IN SOME NATURAL SYSTEMS,
Battelle-Northwest, Richland, Wash. Pacific Northwest Lab.
L. L. Eberhardt, and R. E. Nakatani.
Available from Clearinghouse as CONF 670503 at $3.00 in paper copy and $0.65 in microfiche. Symposium on Radioecology, Proc 2nd Natl Symp, Ann Arbor, Mich, pp 740-750, May 15-17, 1967. 1 tab, 36 ref, disc. CONF-670503.

Descriptors: *Radioecology, *Model studies, Ecology, Food chains, Ecosystems, Systems analysis.
Identifiers: *Radioactivity uptake, Ecosystems modeling, Uptake and retention models.

When the effects of connected compartments and auxiliary influences are ignored, simple uptake and retention models hold promise for use in appraising the substantial variability observed in the radionuclide content of individuals and populations. Although animals tend to function as 'integrators' over their food sources, relative variability in radionuclide content does not increase up the food chain as one might expect. One major cause of observed variances may often be variability in loss and excretion rates. The observed variability in body-burden from individual living in the same general environment may need appraisal in terms of at least three components: (1) that due to fluctuations in intake (stationary and non-stationary), (2) differences in metabolic rates associated with size, and (3) the usual melange of small individual differences which contribute to 'residual error' in a balanced analysis. (See also Vol 2, No 18, Field 05C, W69-07441). (Huff-Wis)
W69-07844

EFFECTS OF TEMPERATURE ON THE SORPTION OF RADIONUCLIDES BY A BLUE-GREEN ALGA,
Du Pont de Nemours (E. I.) and Co., Aiken, S. C. Savannah River Lab.
R. S. Harvey.
Available from Clearinghouse as CONF 670503 at $3.00 in paper copy and $0.65 in microfiche. Symposium on Radioecology, Proc 2nd Natl Symp, Ann Arbor, Mich, pp 266-269, May 15-17, 1967. 7 fig, 2 tab, 5 ref.

Descriptors: *Algae, *Radioisotopes, *Sorption, *Temperature, South Carolina, Cesium, Strontium radioisotopes, Zinc radioisotopes, Iron, Manganese, Benthic flora, Streams, Cultures, Cobalt radioisotopes.
Identifiers: Savannah River Laboratory, Plectonema boryanum, Reactor.

The effects of temperature differential (15 degrees Celsius) on sorption of cesium-137, zinc-65, iron-59, cobalt-57, and manganese-54, by the filamentous cyanophyte, Plectonema boryanum, are reported. The alga was collected from reactor effluent streams. Unialgal cultures were developed. Cultures were grown concurrently at four water temperatures and samples weighed and radio-assayed after exposures of increasing times. This species grew best between 30 C and 40 C. Growth was not affected by low concentrations of radionuclides in the medium. Radionuclide concentrations at the various water temperatures were compared. For a given water temperature, sorption levels differed for the radionuclides studied because of variances in specific activity and biological demand for various elements. The essential elements of manganese-54, xenon-65, cobalt-57, and iron-59, were sorbed to higher levels than were the nonessential elements, strontium-85 and cesium-137, perhaps due in part to their physical state; only cesium-137 and strontium-85 were present, mainly in ionic form. Since sorption levels for the various radionuclides were raised or lowered by factors less than 2.5 by the temperature differential, the conclusion was drawn that nonlethal variations in water temperature have no major influence on the sorption by P boryanum of the radionuclides tested. (See also Vol. 2, No. 18, Field 5C, W69-07441).
